THE new Roman Catholic church of St. Cuthbert, Palatine Road, Withington, was formally opened on Sunday last. The new church, which is estimated to cost 15,000*l.*, has been designed by Messrs. W. Telford Gunson & Sons, of Manchester, and is in the Byzantine style of architecture. In this respect it is a reproduction in miniature of the new Roman Catholic cathedral at Westminster. The length of the building is 100 feet, the width across the transepts 68 feet, with a height throughout of 60 feet. The church, which provides seating accommodation for 450 people, is handsomely decorated by means of a high dado of tiledwork that extends all round the building. The rest of the walls are of polished brick, in which spaces are left for the insertion of pictures of the stations of the cross or of saints. The church is lighted by electricity, and when the walls have dried sufficiently a new organ will be placed in the gallery which has been erected over the sacristy and the confessionals.

## BUILDING AND BUILDERS.

OWING to the rapid growth of the urban district of Kirkby-in-Ashfield, Notts, the Council have resolved to extend their waterworks, and have instructed Mr. J. R. Elliott, water and sanitary engineer, of Nottingham, to prepare a scheme for doubling their present capacity.

THE foundation-stone of a United Methodist Free church which is being erected in Lawrence Road, Liverpool, was laid by the Lord Mayor (Mr. W. W. Rutherford) in the presence of a large gathering of members of the denomination. The church is in the Renaissance style of architecture, and is of red brick with white stone facings. It will seat about 450 persons, and the schools underneath will have accommodation for 350 children.

54 to 58 Castle Street, Long Acre, W.C.

Manufactory: White Lion Street, Long Acre, W.C.

In his report on the circumstances attending the collapse of the tunnel near Loudwater, which is being constructed by Messrs. Panting for the Great Western and Great Central Railways, Mr. C. L. Morgan, the Board of Trade inspector, considers that the timbering ordinarily in use is not of sufficient strength to bear any sudden additional pressure, and that the collapse was due to an unexpected strain from the excessive weight above. As there was no sign of any fault, the mishap must be held to be a pure accident, the tunnel being driven through chalk to all appearance sound and good.

SOME time ago a small dispute arose between Messrs. Tomkinson & Sons, builders, and some of their plumbers respecting the amount of money due to the latter. The board of arbitration, consisting of four masters and four employes, appointed to interpret the rules affecting such a case as the one in question, was not called upon to act, the operatives employed on Messrs. Tomkinson's jobs and at their shop being instead called out. This has led to an extension of the trouble, the Master Builders' Association of Liverpool having issued a forty-eight hours' notice, expiring on Saturday, to lock-out the whole of the operative plumbers in the Liverpool district unless the men at Messrs. Tomkinson's returned to work. This they had not done up to Saturday, and, consequently, the lock-out notice took effect. Upwards of 300 plumbers are affected.

### ELECTRIC NOTES.

THE recently completed electric-light and power works at West Drayton were publicly declared open by Mrs. Donaldson Hudson, of Cheswardine, on Monday evening. The function was a brilliant one in every sense, for, in addition to the influential company present, the whole of the town was during the evening brilliantly illuminated with thousands of fairy lamps arranged with telling effect. At the conclusion of the ceremony Mrs. Donaldson Hudson was presented with a switch letter-weight as a memento of the event.

AT the meeting of the Rugby Urban District Council, the electric-lighting committee reported having considered the electric-lighting scheme in view of the refusal of the Rugby School authorities to take their supply from the town, and they unanimously recommended the Council to proceed with their scheme with all possible speed. Certain alterations in the routes in which it was proposed to lay cables—made possible by the refusal of the School—would reduce the present capital

outlay by 2,000 $\frac{1}{2}$ %, and, assuming the demand would amount to 100,000 units, there was an estimated profit on the first year's working of 213 $\frac{1}{4}$ %. Mr. Hunter, in moving the adoption of the report, said there was a great future for the electric light in Rugby, and the undertaking should be in the hands of the ratepayers. Mr. Styles wanted to know what caused the School authorities to withdraw. There was a loophole somewhere, and he wanted to put his finger on the spot. Mr. Hunter said he did not know it was possible to put a finger on a spot in a loophole. The report was adopted, Mr. Styles alone dissenting.

### INFLUENCES AFFECTING MODERN BUILDING.\*

To start making a list of all these influences recalls a political skit of some years ago, when it was reported of a statesman who was described by another statesman as being as fluent as a waterspout after rain, that it took less time to repeat all the things he did not say than those he did. The number and variety of influences which affect modern buildings is so extensive that a few moments' consideration suggests the almost impossibility of tabulating them. Cost, choice of materials, site, aspect and similar considerations necessarily come first; but the prevailing architectural fashion, the restrictions which the liberty of the subject in a free country must impose—and very frequently the certainty that local development will within a limited time and under progressive conditions sweep away the building we now erect in favour of others embodying features as yet unknown—are even more potent factors.

To fully appreciate the effects of these influences, a little modern history will be sufficient; in fact, no line of argument is ever so clearly convincing or so directly emphatic as that of comparison—the old with the new, for example, in the present instance.

Compare the building materials we now employ with those of one hundred years ago. Bricks were then made partly of clay, variously described as sand-stocks, slop-moulded, hand-made, whilst to-day almost universal is the use in this city of machine-made shale-bricks, possessing probably not a particle of clay, and almost equally common on the continent of Europe is the use of hollow bricks made of pure clay. The old sand-

stock weighed about 6½ lbs., and absorbed after immersion about 8 ozs. of water. The shale-brick of to-day weighs about 8½ lbs., and absorbs from 15 to 30 ozs. of water, whilst the continental hollow brick weighs about 5½ lbs., and absorbs about 3 ozs. of water.

The result of this is that whilst cavity walls were unknown till recent years, and are rarely used in Europe, they are with us almost an article of architectural faith with many of our architects, more especially the younger men.

Take another building material—gall-corr-iron—which especially in the country is used so extensively that it is generally a matter requiring some tact and persuasion to induce clients to adopt any other roofing cover. One hundred years ago this was practically unknown. The effect of the so general use of corr-gal-iron for roofing is the flat roof of light construction, the wearisome monotony of most of our country towns, the avoidance of materials which nature in many instances provides close to hand such as shingles, and a general lowering of the standard of design.

Or if we take the material with which we finish the interior walls of our houses, known as plaster, stucco and one or two other names, we find an equal variance between the old and new conditions. In early days shell-lime burnt at Cook's River and sand mixed with "Paddington loam," as it was called, were used for plaster, the loam containing a portion of clay. Now stone lime slacked some weeks before using, mixed with sharp sand washed free from clay, is most in demand in Sydney, whilst in France a thick coat of a rough quality of what we know as plaster-of-Paris would be used.

Formerly all our laths were split, generally of stringy bark, now generally of sawn pine, wire netting or expanded metal, whilst in many instances fibrous plaster in which plaster-of-Paris is the principal ingredient is taken in large blocks ready made to the job and screwed into position.

At one time so universal was it that the base on which every building sat was a block of stone that the expression "foundation stone" became an idiom; now, however, you will commonly hear a builder describing to another the progress made by explaining that "the concrete" is complete, meaning the footings, clearly showing how concrete has displaced stone, especially in building work of a heavy character. Concrete on the Monier and kindred systems is developing possibilities of which we never dreamt, whilst fireproof flooring containing 40 per cent of coke has been generally approved by architects, and as generally condemned all within a few years, owing

partly to the fact that in a few of our public buildings the fireproof coke concrete caught fire, and partly because it was found that the combustible material used in this concrete was about twice as great as the fuel needed to burn the terra-cotta lumber which is now coming into general use for fireproof ceilings and partitions.

In stonework we find that Governor Hunter wrote to the Downing Street authorities from the neighbourhood of the Sydney Exchange that neither clay for making bricks nor stone suitable for building were obtainable in the settlement, so that all the buildings must be erected in wood. Later on the Governor reported that he had found suitable clay in the country some miles from the settlement—that is to say, near Christ Church—but that no building stone was available.

Another stage is that of the use of stones so small that one man could turn them about, one reason for which is made obvious by the hieroglyphics by which some early Australian masons, who were not necessarily freemasons, showed how they spent their time.

A later development was the use of very large stones moved by steam cranes, whereby the labour on the beds and joints was greatly decreased. In this connection I can recall an incident in which our worthy President was one of the parties. A builder who felt sorry for himself in being unsuccessful in obtaining a job from that architect's office, and who probably appreciates that the increasing size of the blocks of stone would necessitate an expenditure for heavier cranes, &c., quoted to me, who was then only a boy, that the way to get a job in Mr. Mansfield's office was to offer to make the whole front in one stone.

But to leave building materials and to pass on to other influences. Years ago there was no sewerage system necessitating large areas to each building, as also the discharge of house water over the surface. In fact every man did what appeared right in his own eyes. That this neglect of sanitation was a danger, and was periodically appreciated by the authorities, is apparent from the regulations issued by the early Governors, that all huts within 100 yards of the Tank Stream, which was the only water-supply, were to be at once removed, and that any woman found washing clothes within a like distance would be severely punished. Or to go further afield, we learn from the reports of a commission appointed to inquire into the causes of cholera in England half a century ago, that as the farmer regarded the fertility of his land as of the first importance, and this was dependent upon his supply

of manure, this was a matter of such consequence that he usually heaped it up against the blank wall of his residence, so as to be both literally and figuratively under his own eye. Instances of the ignorance or laxity in sanitary matters might be quoted without end as existing fifty years ago, but now in this city we are blessed with three distinct varieties of sanitary inspectors, who in their enthusiasm occasionally exercise the authority they possess to the extent of compelling a city taxpayer to lay bare for their inspection a drain-pipe which apparently is working well and satisfactorily, but which might, in some respect, be capable of improvement. That this influence upon modern buildings has been an unqualified success we architects all agree, but never so fully do we appreciate it as by comparing matters as they are, bad as they may be, with what they were in years gone by.

I am told that in 1898 a building was erected in Park Row, New York, 429 feet high, and consisting of thirty-three floors, including cellars, half storeys, rooms in roof, &c. Such a building was impossible, financially at least, before the year 1855, when the invention patented by Henry Bessemer enabled steel to be produced from iron at a small cost, bringing down the price from about 90% to 9%, in round numbers. This building contains 7,000 tons of steel, which cost about 70,000%, as against about 700,000% before Bessemer's invention. Without this steel construction the basement walls if made of sufficient thickness to support with safety the great height would have made the lower storeys almost solid brickwork.

Our forefathers lived in houses rarely exceeding three or four storeys in height, of which the top floor was almost entirely composed of lumber-rooms, garrets, servants' quarters, &c., for which purposes alone was it suitable owing to the serious drawback of the stairs.

Their living-rooms were almost entirely on the first and ground floors.

The rapidly increasing use of hydraulic lifts enables the tenth floor to be made as accessible as the third, so that the same area of roof covers a very much larger building.

Gas, electricity and telephones have introduced further influences on design, as there is now no need for the coal-cellar, the lamp-room, or the wire-pull bell, as by pressing a button the room becomes brilliantly lighted for the exact length of time desired; by turning on and lighting the gas-fire the room is warmed and brightened, and by means of the telephone a conversation may be had without the intermediary assistance of the messenger. In fact, the very names given as indicating

power, capacity or force in electrical matters, called as they are in many instances after modern chemists and electricians, sufficiently prove how extremely recent is this innovation—ampere, volt, ohm, kilowatt, &c.

That obnoxious insect the white ant is responsible for a good deal, and his influence on modern buildings is considerable.

Probably, however, popular opinions and habits have done more to cause architectural changes than anything else. How rare was a bath-room in houses 100 years ago, but now not only would its absence be worthy of comment, but in a house of any pretension tiled walls, a self-draining floor, a hot-water apparatus, shower, &c., are expected at the least.

In old days a w.c. in conjunction with the living rooms was an impossibility, but now such are usual even where a municipal sewerage system is not available. A reversion to the old-fashioned cesspit, situated 50 to 100 feet from the house, on the ground of health, would be indeed a change for us to-day.

In the matter of water supply, it seems only a few days ago that in Sydney the question of lead poisoning through drinking water from a lead cistern in the roof which was not coated was a burning subject for newspaper controversy, whilst an underground brick tank in which the roof water was stored was the ordinary expectation, even in allotments of 25 feet frontage, where of necessity the w.c. cesspit and the underground tank must have been close neighbours. Now such a proposal would be stopped by the health authorities as an outrage on the public welfare.

A Building Act, which every modern city of any pretensions is bound by, states that only certain materials may be used in the construction of buildings, and that they must be put together of specified thickness, with limited projections to the mouldings, &c., and windows only overlooking certain ways.

The Factories Act provides that the ventilation must be as approved, fire-escape stairs provided, lavatory and other similar accommodation provided to suit the convenience of the workers, with special consideration for the sexes. A dining-room must be provided if the workers demand.

The Act which deals with the licensing of hotels ordains that in any case there must be four bedrooms and two sitting-rooms, exclusive of those required by the family, which rooms must all contain 1,200 cubic feet of air.

Another Act provides that all places of amusement, public

halls, &c., shall have fire-escape exits of a certain class, shall be seated in a certain way and have provision made for fire prevention and extinction.

Regulations of the fire-insurance companies compel, as far as their influence extends, and that is a long way, that the elevator shall be so constructed as not to increase the risk of fire, and that fire-preventers, such as Grinnell sprinklers, iron doors, &c., shall be part of the building.

Again, modern inventions enable new methods to be employed. Thus by hydraulic pressure a self-acting appliance enables a cellar which is below the level of the sewer to be kept dry and wholesome. A ventilating fan, worked by the same power, will drive air into this cellar and keep it fit for occupation, whilst an electric light completes the transformation of a cellar which in old days was a danger to health, and which would have to be filled up to prevent spreading a pestilence, into a light, airy, healthy room, suitable for a good restaurant.

And this system of utilising every invention is rendered necessary by the overcrowding which modern need brings about. The original street of a chain wide was sufficient to allow sunlight into rooms when buildings did not exceed three storeys in height, but an increase to thirty-three floors necessarily prevents any sunlight reaching the lower rooms. If with the increase of a city's population every street progressed in popularity in equal proportions, an increase of one storey in height would add possibly one-third to the accommodation and sky-scrapers would be unknown, but instead of this, most of the increase comes within a small area, which soon induces a congestion of the street traffic, with the natural result of improved means of transit.

The improved transit, tram service or whatever it may be, further consolidates the population during business hours only, as to live whole lives in such the atmosphere would be unwholesome. We find, then, that the modern tendency is not to "live over a shop," as did our forefathers, but to have the shop in the most crowded thoroughfare and to leave it alone between 6 P.M. and 9 A.M., which time we spend miles away in a dwelling from which all connection with our business is kept as remote as possible.

Our ancestors invariably lived in the cities, we never; the population of a city between 9 A.M. and 6 P.M. might be 250,000, but during the rest of the 24 hours not more than one-tenth of that number. All home comforts are now out of place the city, having migrated to the suburbs.

Our ancestors, in a word, had a more limited choice of materials with which to build, fewer appliances for domestic convenience, placed greater reliance on manual service and were less restricted by laws and regulations. As a consequence less was expected from the architects of their day. On the whole, however, it would, I think, be incorrect to say that their buildings were more solid or enduring than ours. Owing probably in a large degree to the inevitable evolution which all building sites undergo in such rapidly changing phases, our architects are accustomed to seeing—1st, a suburban allotment with a detached house in the centre; 2nd, an additional house on the vacant ground on each side; 3rd, additional rooms in the front garden to be used as shops fronting the street; 4th, the whole pulled down to make room for a different class of building. All these changes within probably one generation; they therefore hesitate about putting more material, and consequently more solidity into a building than the site would warrant.

Unfortunately, any consideration of the influences affecting modern buildings brings to mind such extraordinary changes mostly in favour of the rapidity of modern methods that all kind of absurdity passes current for facts. One such instance is fresh in my mind. An article in the *World's News*, of recent date, speaks of the wonderful rapidity in building made by a contractor whose name was Stewart, and who came, as might be expected, from America. Amongst other evidence of his ability, he induced bricklayers who had been accustomed to lay 400 bricks per day to increase this tally to 2,000 per day. If it were humanly possible for one pair of hands to lift and set 8 tons of material in proper position in the day, or at the rate of a brick to 15 seconds, kept up for eight hours, what class of work would be the result and what time would such work last?

A return supplied to the Minister for Works shows that by day labour the average at the University during 206 days was 839 per day per man, and at the Art Gallery during 371 days 559 per day per man, while at a specially quick country job, where no stuck faces were visible, two men laid 126,000 in eight weeks, or 1,250 per day per man.

During the last eighty years the wages of artisans have greatly varied; for example, a bricklayer's wages per day have been in Sydney as follows:—1823, 6s; 1833, 5s; 1843, 5s; 1853, 15s. 6d; 1854, 30s; 1863, 10s; 1873, 10s; 1883, 12s. 6d.; 1893, 10s; 1895, 8s. 6d.; 1902, 11s.; whilst the same class of bricks sold in 1883 for 3d. per 1,000, in 1893 17s., and at the

# CABOT'S INSULATING & DEAFENING QUILT.

## A PERFECT DEAFENER.

Prevents the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this. Send for Special Book on Schoolhouse Acoustics, illustrated.

## A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Decay moth, and vermin-proof, and unflammable.

## FIREPROOF, DEADENING.

A fireproofing result infinitely superior to that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

## CABOT'S ASBESTOS "QUILT."

present time 38s; whilst many other building materials have varied proportionately.

The decade between 1880 and 1890 was noticeable, in this State and Victoria, as the age when jerry building in its worst aspect was rampant; but the passing of an Act, known as Reid's Act, to regulate the width of streets and lanes, although not directly referring to buildings, has indirectly had a depressing effect on this class of property in this State, possibly because a better thoroughfare merits a better class of building.

Some of the materials now in common use, such as metal lathing, fibrous plaster, Bagasse plaster, O.K. bricks, hollow bricks, stamped steel or zinc for ceilings, Monier concrete, opalite wall lining, trachyte, silicate, enamelled iron ware, tar paving, prismatic pavements, &c., were unheard of a few years ago; whilst cast-iron balcony rails, cement decorations and boxed-in sheet-iron baths were within the last twenty years the height of fashion.

Historians generally agree that the most potent factors in changing during the sixteenth century the prevailing Gothic—which for 500 years previous had dominated England—into the Renaissance were in no sense architectural, but were the invention of the mariner's compass, which doubled the size of the world; the invention of printing, which enabled thinking men to spread their thoughts without restriction, and the invention of gunpowder, which, by changing the entire basis of warfare, diverted the rampant militarism of the age into avenues of adventure and discovery, rather than into domestic and intertribal feuds.

In a similar way the most effective influences affecting modern buildings are, I think, only remotely in many instances connected with architecture; the social habits of a people come easily first with their varying peculiarities. Who can say that billiards, as played with us or in England, has not affected the design of houses? and in all probability ping-pong will do the same. Some years ago small dances in private houses were much more common than now, when fewer and more imposing functions are in vogue, and they are held at public rooms hired for the occasion, whilst the billiard-room, which in former years was essentially a main retreat, is now frequently the lounge where receptions of a less formal character are held for both sexes.

Next in importance comes climate as an influence, and here I would like to point to the absurdity of those who bewail our incapacity as modern architects in not evolving an "Australian style." Just imagine what is conveyed by the word. Could a

domestic house be designed equally suitable for Finland, Greece and Egypt? Because this is almost the grasp of an Australian style. Cogan tells us that during July one half of the Commonwealth has a mean temperature of from 40 to 64 degrees and the other half from 64 to 80 degrees, whilst in December half of the continent never reaches 83 degrees, and the other half goes frequently to over 100 degrees. Even in New South Wales, he says, there are three marked divisions of temperature. The coastal districts north of Sydney have a mean temperature of 78 degrees in summer and 59 degrees in winter, whilst those south of Sydney are 67 degrees in summer and 52 degrees in winter. He adds that "the famed resorts on the Mediterranean seaboard bear no comparison with the Pacific slopes of New South Wales, either for natural salubrity or for the comparative mildness of the summer and winter."

### COLUMNS FOR BUILDINGS.

THE durability of iron or steel columns is such an important element in the possible age, or lasting capacity, of the modern high building that it has once more, says the *Engineering Record*, come to be a subject of most careful and rather wide discussion. The modern steel building frame commonly carries the entire load sustained by the structure, including its own weight, and the columns are the main supporting members of the frame. Any active influence, therefore, which tends to impair the strength of the columns or to trench upon their durability weakens—and possibly fatally—the resistance of the building itself.

The danger of corrosion in iron and steel columns is no new subject of discussion, for engineering literature gives abundant evidence of its recognition at least forty years ago. Some of the most prominent forms of column section in the early days of iron and steelwork were closed, thereby making it impossible to inspect their interiors and to protect them by painting. So essential, however, to its durability was the accessibility of the interior of a column considered that closed sections were permitted in bridge-work for a short period only. The question was ably argued and experiences supporting both sides were cited, but the case was hopeless for the closed section and it was soon abandoned. In spite of this result for exposed columns, like

those in bridges, an entirely different conclusion has been reached in connection with iron and steel columns used in buildings. Although closed columns, even in buildings, have been criticised and their comparatively short life set forth, together with all the sources of corrosion which, it has been alleged, would give them very uncertain tenure of life, they have held their own, and they form to-day the prevailing type of member for buildings. It is true that the Z-bar and some other forms which are not closed have been used to a considerable extent, and that some of the more prominent early closed sections have been either largely or wholly displaced, but the fact remains that the closed box column in one shape or another largely occupies the field in spite of the fact that its interior cannot be painted after the completion of the steel frame.

It is obvious that there must be some strong reason for this particular feature in structural development. It has been many times earnestly argued that the life of such a column must necessarily be limited by attacks of corrosion, both at the interior and exterior surfaces. Nevertheless, it persists, and it must be admitted that any serious danger arising from this particular feature of deterioration yet remains to be established. Undoubtedly, in a considerable number of cases, experience has shown the existence of some oxidation, but to no great extent; and in no case of good design has the rate of oxidation been shown to threaten serious danger within any reasonable period.

It is beyond question that the exposure of a bridge column is far more severe than that of practically any column standing in a well-designed building. In the latter case, compression members are usually entirely surrounded by masonry of one class or another, constituting almost complete protection even when the columns are embedded in an exterior wall, subjected to driving rainstorms.

The fact that every type of box column leads to more simple and convenient detailing than any other class of compression members undoubtedly accounts, in a large measure, for its wide adoption; but this fact alone is not a sufficient reason for the existing situation. In addition to it there is at least the strong opinion, based upon considerable experience, that no sensible amount of corrosion need be apprehended with any period affecting immediate values or those likely to exist in the near future. It may not be demonstrable that this judgment is not defective, but it is beyond reasonable doubt the most potent factor in the persistence of the closed column. Whether further developments in building construction will

continue the use of that column is a different question. Experience has shown enough to indicate, however, that when the box column or its type is displaced by another, the governing influence will be greater economy or some motive other than apprehension of interior corrosion.

The development of concrete-steel construction may indicate the field in which the improved column is to be found. Although the combination of concrete and steel has thus far been employed where greater tensile resistance than that of concrete alone has been imperative, it does not by any means follow that it may not be found advantageous for compression members, especially where a high capacity of resistance to heat of conflagrations is desired. Nearly all steel columns in buildings are enclosed in terra-cotta or masonry of one kind or another, either to secure a more ornate appearance or protection against high temperatures caused by fires. It is but a short and easy step to secure both of these results by a suitable combination of concrete and steel bars other than the usual steel compression member. In a number of cases the interiors of steel columns have been filled with concrete, with an exterior covering of brick or other similar fire-resisting material. Abundant experience has demonstrated the efficiency of concrete protection against corrosion when the concrete is suitably mixed and put in place. A relatively wet mixture is needed so that voids will not exist, and also that the surface of the steel may be covered with a wet cement coating. When steel is so completely embedded in a relatively large mass of concrete it receives rigid lateral support, enabling it to act in compression like a short block rather than like a long column. Under such circumstances each square inch of steel section may properly be assumed to carry much more load than when under conditions requiring the use of a column formula. Again, the concrete is so circumstanced as to sustain a large load itself, probably not less than 40 to 50 tons per square foot. Indeed, by suitably reinforcing the surrounding concrete with light steel sections, such as wire, the concrete's loading could probably be increased to 70 tons per square foot, without violating the canons of good practice. This development in the design and construction of compression members would possess a number of material advantages, including economy. The less expensive shapes of steel could be employed under much higher unit loads, and their combination with concrete would result in a solidity of section making the compressive resistance of that material available as well as attaining complete fire-resisting capacity.

## THE USE OF GAS FOR WARMING ENCLOSED SPACE.

By THOS. FLETCHER, F.C.S.

I HAVE been asked to reply to an article in the *American Gas Light Journal*, by Dr. W. H. Birchmore, on the above subject. It would be a waste of time and space to traverse and disprove the whole of his curious statements and "assumed" figures; the correction of some of the simple and most glaring errors will be sufficient. It must, of course, be borne in mind that the system of heating used in this country is totally different to that in America, and that the close, dry heat and absence of ventilation there would not be accepted here, and the criticism refers in its fullest sense only to the English methods, although as regards actual facts and practice in America Dr. Birchmore's errors are too glaring to be allowed to pass.

The figures given as a case in practice refer to a room 16 by 12 by 8 feet, 1,536 cubic feet air capacity. According to the English hospital standard, 500 cubic feet space is required for each adult; the room would therefore be large enough to be permanently occupied by three persons. The smallest space allowed in English common lodging-houses is 240 cubic feet for each, and at this rate the room would accommodate say seven persons for sleeping only, to be thoroughly ventilated during the day. The smallest amount of fresh air considered necessary for respiration in English and continental hospital practice is 500 cubic feet per hour for each adult, *i.e.* 1,500 cubic feet for three persons, yet the "Doctor" "assumes" that 100 cubic feet only will be required; why he assumes that the recognised healthy standard is fifteen times too large he does not state. "With a ventilation of 212 cubic feet per hour per head M. Peclet found a slight odour in a public school of 180 children of the age of seven or eight years" (see Box, "On Heat," page 243). For cleanly and healthy persons the accepted minimum is 250 cubic feet for respiration, &c. and 60 cubic feet for lighting. These are the quantities proved to be necessary by the greatest authorities as standards; the fact that Dr. Birchmore "assumes" they are all wrong does not carry much weight, and as his figures are based on this standard, evolved from his imagination, they are of little use.

With regard to heating the air of the room, it may be

accepted that 1 cubic foot will heat 825 cubic feet of air 42.5 degrees, as stated. This, of course, varies greatly with the composition and heating power of the gas, which in the United Kingdom will vary 30 per cent. or more, but that this air when warmed will retain its heat is a state of things existing in Dr. Birchmore's imagination only. The loss of heat by walls and windows has never in any experiments I have made, or in the reports of any trustworthy authorities, been less than 75 per cent., and varies from this to 87½ per cent., independently of ventilation. The most charming point of all is that he "assumes" a renewal of 125 cubic feet per hour in a room 1,536 cubic feet capacity, *i.e.* less than once every twelve hours. Now, as all the greatest authorities state that 500 cubic feet of fresh air per hour will be necessary for each healthy adult, and that the air in the room, if it is to be kept sweet, must be entirely renewed at least three times each hour, and more frequently if possible in case of sickness, it becomes rather interesting to know the result of the proposed reduction. It would probably be difficult to match even in the foulest and filthiest underground Chinese dens; certainly the most crowded and dirtiest English common lodging-house would be paradise compared to it.

I will leave out the question of the comfort and consequent urgent demand in this country for radiant heat in preference to warmed air, flueless stoves and other sources of convected heat, which, although very much cheaper than radiant heat, is greatly disliked in this country. It is possible, under the best conditions, to reduce the loss of heat by a flue to 28 per cent., but such economy as this will be very rare, and it may be taken in average English and continental practice that the flue loss where radiant heat is obtained in any large proportion will be quite 50 per cent. Taking this, the "assumed" 100 cubic feet for ventilation being at least fifteen times as great, and the actual loss by walls and windows being at least 75 per cent. of the whole, Dr. Birchmore's "assumed" figures require a little correction. It would appear that he has actually obtained the results stated in practice, and that by some wonderful method he has done away with loss of heat through walls, &c., opening doors and the many other ways in which heat disappears, and this opens up a new vista and a source of heat hitherto neglected, which should render all fires and stoves unnecessary. It has been found that 284 units of heat are generated per head per hour, and this heat must be dissipated to keep the body in health. It would occupy too great a space to go through the calculations and trace the

authorities, but those interested will be able to do so by reference to Box "On Heat," page 243. As the average heating power of our local gas is given as 720 units per cubic foot it will only be necessary for three persons to remain in the room to make it too hot for comfort, and that being the case, as proved (?) by Dr. Birchmore, no other heating apparatus will be required, and his wonderful stove, which will probably be brought out with a great flourish and offered for sale, is proved by his own figures to be totally unnecessary, every person being his own stove and warming apparatus, with a decided margin of power to spare. All this great discoverer needs now is to invent a method of utilising this spare heat for lighting, and we should then be both warmed and lighted by our own natural forces. Evidently the resources of nature are limitless, and the dreams of the most sanguine fade into insignificance before this, the greatest discovery the world has known. If he will perfect this I shall only be too pleased to negotiate with him for the English patent rights.

### INSTITUTION OF ELECTRICAL ENGINEERS.

A MEETING of the Institution of Electrical Engineers (Dublin section) was held on Friday evening in the Royal College of Science, Stephen's Green, Dublin.

Professor Barrett, F.R.S., presided at the opening. There was a good attendance.

The honorary local secretary, Mr. Tatlow, said the local section now numbered sixty-one members. Since their last meeting they had lost their chairman, Mr. J. W. Towle, and their hon. sec., Mr. Frank Gill. Mr. Porte, their vice-chairman, had been elected chairman, and Professor W. E. Thrift, vice-chairman for the present session. Mr. John Irwin, secretary of the electric-light committee, entertained the members of the local section at the Pigeon House on September 27, when they viewed the progress of the works, and Mr. W. Brew explained the arrangement of the generating plant.

Professor Barrett said that few societies had in one session suffered so great a loss as the removal to London of their chairman and hon. secretary. They rejoiced that those gentlemen had been offered those high and responsible positions, and they were glad to think that to fill the positions of Chief Electrical Engineer of the Metropolitan Railway and of the

National Telephone Company, England had to come to Ireland to get what she wanted. In introducing to them his old friend and demonstrator, Mr. Porte, as the chairman for the coming session, he was sure they would hear from him an interesting and instructive address.

Mr. Arthur E. Porte then took the chair. He thanked his professional brethren for the honour conferred on him in placing him in the position of chairman of their section. They were aware that Mr. Towle had been elected to the position, but fortunately for him, and unfortunately for them, he was sought out by the promoters of the electrification of the London Metropolitan and District Underground System, and offered the leading position on that great undertaking, a position which he was bound to fill with great distinction, and he (the chairman) felt sure that Mr. Towle had the very best wishes of every member of the section. To give them some idea of the extent of the station Mr. Towle was about to erect in London, it would be ten times as large as the splendid generating station of the Dublin United Tram Company. In congratulating Mr. Towle on his appointment, they should also congratulate their colleague, Mr. Percy Sheardown, on being promoted to the position lately occupied by Mr. Towle. Mr. Sheardown was a young man for so responsible a position, and it was pleasant to think that the Board of his company had such confidence in his technical and administrative ability, and that they were able to promote from their own staff to the highest positions in the service. The Chairman then spoke in complimentary terms of Mr. Gill, who had been appointed chief engineer of the National Telephone Company. They all congratulated him on the appointment, and wished him success. They could not allow him to sever his connection with them without marking the occasion, and accordingly they arranged to present him with the piece of plate (a centre piece) which they saw before them. The Chairman then proceeded with his address, in which he dealt with the supply of electric energy for lighting and power. Their new lighting and power station in Dublin was approaching completion, and they trusted it would prove commercially possible to supply current for power purposes throughout the city at a price which would induce a large number of their manufacturers to employ electric driving in their works. He also dealt with recent progress in the design and manufacture of gas, and concluded the reading of his paper amid applause.

Mr. Gill then read notes on a hydro-electric phenomenon, after which

The Chairman made the presentation to Mr. Gill, and he expressed their best wishes to Mr. and Mrs. Gill.

Professor Barrett in warm terms added his testimony to the services rendered to them by Mr. Gill, who, he said, had been an ideal hon secretary. When Mr. Gill accepted the position in London, Mr. Tatlow kindly took up the duties of hon secretary, and admirably had he discharged them. They also owed a debt of gratitude to Mrs. Gill and her lady friends for all they did to render attractive their social meetings. They trusted that Mr. and Mrs. Gill would long enjoy their new sphere of life and labour, and they wished them every happiness and prosperity.

Mr. Gill expressed his thanks for the presentation, and Mr. Tatlow acknowledged the friendly references made to himself. The proceedings then terminated.

### NATIONAL REGISTRATION OF PLUMBERS.

A LECTURE was delivered at the Manchester School of Technology on Wednesday last by Mr. J. A. Young, R.P., to a large and appreciative audience composed of registered plumbers, sanitary inspectors, students, apprentices and others interested in sanitary science and its advancement. The lecturer, who was introduced by the Chairman of the Manchester District Council for the National Registration of Plumbers, had taken for his subjects soil, waste and ventilating pipes, sanitary fittings, water supplies and their sources. By means of a powerful electric lantern and slides the various methods of jointing and fixing soil pipes were exhibited, and illustrations of bad and defective work, the features of which were pointed out, and the reasons why such methods were to be condemned. The lecturer went on to explain the evolution of the modern soil-pipe and the advantage of small over large ones—the necessity of ventilation to afford an egress of carbonic acid and other gases, and also to prevent syphonage of traps in connection with fittings.

The next item dealt with was waste-pipes. Various kinds of traps were thrown upon the screen, good, bad and indifferent, one illustration being the very common one some years ago of fixing a bell-trap to a scullery sink with the waste discharging into a "dipstone" trap constructed inside the house. The diameters of wastes for various purposes were touched upon, also the importance of easy bends when change

of direction became necessary, the expansion and contraction of pipes due to the passage of hot and cold water. Lead, heavy cast-iron, glass-enamelled cast-iron, galvanised cast-iron and zinc all received their due appreciation and the latter its just condemnation.

In speaking of the question of water supply, Mr. Young remarked that the risk of contamination at the present time was fortunately very much less than it used to be. A series of seven or eight slides were exhibited, indicating how easily water might be contaminated by improper connection and overflows and cleansing wastes to soil-pipes, by the old service-box, the stool-cock and other methods now recognised as highly dangerous. The pollution of wells by leakages from cesspools was next shown, sectional slides being employed to illustrate this. The qualities of a good drinking water were next introduced, it being shown what these were, and that although water from a chemical point of view may be a potable one, that a bacteriological examination was necessary, as a chemical test did not reveal the presence of bacteria which might be dangerous and deadly in their character.

In conclusion the lecturer said he regretted that the time at their disposal did not allow him to go more fully into the water question, and that his subjects had been perhaps too large to deal adequately with in a single lecture, and that his desire had been to place something of interest before all the members of his audience. He then thanked them for the genial welcome they had afforded him and for their courteous attention.

A hearty vote of thanks was proposed by the Chairman, who said it was very evident they had listened to a practical man, and that he himself had done so with great pleasure, and he hoped the audience had. This was seconded by a member of the audience, who testified to the skill and knowledge that had been exhibited in the lecture they had listened to.

Votes of thanks to the Chairman and Secretary concluded the proceedings.

### WIDENING LONDON BRIDGE.

THE Corporation of London determined some time ago to widen London Bridge. The proposal caused much outcry, as it was considered little less than sacrilege to touch Rennie's Classic design. But although the simplicity of the structure will be somewhat sacrificed and there will be a loss in the severer beauty of the design, there will, it is maintained, be a gain in picturesqueness.

The widening is being carried out, says the *Times*, under the direction of Mr. E. Cruttwell, M.Inst.C.E., as engineer, and Mr. Andrew Murray, F.R.I.B.A., as architect, the resident engineer being Mr. Cole. The work will be begun by building out corbels or cantilevers from the existing bridge. These granite brackets, as they may be described, will carry the new footways, and there will be at intervals refuges where standards for lights will be placed. By means of the hanging structures or galleries thus built out it will be possible to widen each footway from 9 feet 6 inches to 14 feet, and the roadway will also be widened by 2 feet 6 inches, bringing it up to 37 feet. To build out a substantial stone structure such as this entails some heavy work, and necessarily the existing footpaths must be blocked to traffic, though the roadway will be kept open. The engineers have therefore built out on each side of the bridge a temporary steel footbridge, which will also serve the important purpose of a gantry to carry the travelling cranes used for the work. Each of these temporary bridges consists of five spans, one 157 feet 7 inches and four 145 feet 5 inches. The spans run on each side alongside the permanent bridge, but are placed a few feet away from it for purposes of construction. The sides of the spans consist of lattice girders between which the passengers will walk, whilst the top booms of the girders will form a runway for the travelling cranes, by aid of which the new masonrywork will be put in place and the old granite parapet and pavement will be dismantled. The span girders are 12 feet 6 inches deep, and the rails upon which the cranes run are supported on timber placed on the top flanges of the girders. In order to protect passengers during the work an iron roofing covers the footpath, there being thus formed a covered way which will be much appreciated during wet weather. On each temporary bridge or gantry there are two 5-ton electric travelling cranes, and by them the blocks of stone for the new work can be lifted from barges in the stream below and set in place without interfering with the vehicular traffic or with the foot passengers in the covered galleries of the temporary bridges.

In order to avoid delay and to prevent obstruction through foundations in the river bed, a very ingenious method of supporting the spans, &c., has been devised. The piers of the main bridge have been utilised, and as they project laterally a very much smaller distance beyond the main structure than the distance at which the temporary bridges are placed, it is evident that the supports for the latter have, as they go down, to rake inwards towards the bridge. These struts or supports,

each about 25 feet long, are of steel, built up in the form of a box girder, and are placed in pairs. The piers project far enough for one support to be vertical, but the other has to be at a considerable angle from the upright. To support the lower ends of the struts large steel shoes, bedded in with concrete, are fitted to the upper surface of the granite piers. It will be evident that when any considerable weight is placed on the struts which form the piers of the temporary bridges—such as the erecting cranes, with their loads, and the passengers—the tendency would be for the whole mass to fall outwards, describing a segment of a circle of which the steel shoe on the pier would form the centre. In order to prevent this the two temporary bridges are attached to each other by ties, which pass through the roadway of the main bridge. There are two ties to each pier, and they consist of flat steel bars 12 inches by 1 inch. In this way attachment is made between the opposite piers, which thus form cantilevers. At the shore ends the temporary bridges are supported by timber trestles built up from the stairs leading down to the river. The spaces between the ends of the steel girders, where they rest on the cantilever piers, are filled up with timber so as to afford a continuous runway for the cranes.

The erection of the steel spans was a task of some difficulty, as it was not permitted to put false work in the river so as to obstruct the arches. The largest spans weighed 75 to 80 tons each, and these had to be raised bodily 30 feet to 35 feet and deposited on the piers. The contractors for the erection were Messrs. J. H. & W. Bell, of Liverpool, a firm which devotes itself to work of this nature. The general contractors for the whole work, it should be stated, are Messrs. Pethick Brothers, of Plymouth, whilst the contractors for the steelwork are the Patent Shaft and Axletree Company, of Wednesbury. The steel girders were put together on a large floating pontoon moored near the bridge. This pontoon was 113 feet long, 60 feet wide and 7 feet deep. To assist in building up the girders a track was laid from end to end on which a steam travelling crane ran. The steelwork was delivered on to the pontoon in sections of a size convenient for transportation from Wednesbury, and the parts were bolted together to form the spans. The pontoon was then placed athwart the arch against which the span had to be erected. It was very necessary that the pontoon should be held securely and steadily in the right position for depositing the span, and some remarkable ground tackle had to be used for moorings. The pontoon being in position the operation of raising the lengths of lattice girder-

work was begun. For this purpose two sets of legs, or galleys frames, were erected on the pontoon at a convenient distance apart. Each one consisted of two balks of pitch pine 48 feet long, and in cross section 20 inches by 25 inches square. These uprights were connected at the top by a cross-piece to which the lifting tackle was attached. By means of steam winches on the pontoon the span was raised and deposited in position on cantilever piers. To remove the pontoon it was necessary to lower one of each pair of the timber balks, and this was made possible by pivoting them at the deck, much in the same way as the mast of a sailing barge. The transom pieces connecting the two balks had also to be up-ended.

It will be seen that the work was of some magnitude to be carried out on a floating platform, moored transversely to the run of the tide, but the difficulty of the operations was increased by the limited time allowed. The actual lifting of the spans occupied between fifteen and twenty minutes; the time required for taking the pontoon from its original position and back again was about three hours. In this work two of the powerful "Kaiser" tugs were employed, and a good deal of skilful watermanship, in which the Thames men are not surpassed by those of any other river in the world, was displayed. The time for fixing the ten spans was fifty-four days, the total weight dealt with being about 800 tons.

The whole work is an instance of the importance now attached to the continuity of traffic. If London Bridge could have been closed the work of widening would have been simple; but even if one footpath at the time had been appropriated, with perhaps a small part of the roadway, the need for the two temporary bridges would have been obviated. Again, had the contractors been allowed to obstruct the river, the need for speed in the erection of the spans would not have arisen—and speed in such work means expense. As it is, a novel piece of engineering work has been creditably carried out, and there will be no damming of the ceaseless streams of traffic that pass over and under London Bridge.

#### THE ABBEY CHURCH OF DORE.

THE Bishop of Hereford is strongly supporting an appeal for further subscriptions towards the repair of the freehold Cistercian abbey church of Dore. In a letter on the subject he

says:—"Both for its architectural beauty and for its historical associations the church of Abbey Dore may claim to take rank among the most interesting ecclesiastical buildings in England, and its preservation from ruin is consequently much more than a matter of merely local interest. Standing as it does in a lovely valley, it will well repay a visit from all who are interested in ecclesiastical architecture, and we shall be very grateful to every Churchman who, out of regard for the beautiful churches which form no mean part of our common inheritance, will give us some generous help in our effort to preserve it."

From a circular letter signed by the Archdeacon of Hereford and Prebendary Maddison Green, hon. secretaries, and the rector of Abbey Dore, the Rev. A. Phillips, it appears that the church had been for some years in a very bad state, and the condition of the roofs and floor was deplorable. Subscriptions and donations received have up to the present time been almost sufficient to cover the cost of relaying the old pavement, underpinning some of the buttresses, a complete system of drainage, and repair to the roofs of the presbytery and tower and to the parapet of the latter. These works have been in hand for some months, and are now nearing completion, while all further work for the present has been suspended. A sum of 2,000*l.* is now urgently needed to clear off a debt of about 150*l.* and to repair the roof and ceiling of the transepts, which are in a very dangerous condition, and for other minor structural repairs which will be necessary for the safety of the fabric. Up to the present time the funds subscribed have come largely from the county of Hereford and adjoining counties, about 1,700*l.* having been raised. Not only is it a very valuable and unique example of a Cistercian abbey church, but, having been preserved from ruin by Lord Scudamore in 1634, it also has a great many points of interest of this later date. In addition, many objects of interest and details of the planning, hitherto buried, have been brought to light, and the value of the building has been thus considerably increased. The work is being carried out by Messrs. Collins & Godfrey, of Tewkesbury, under the superintendence of the architect, Mr. Roland W. Paul, F.S.A., of London. In a few weeks time the work now in hand will be completed, and the committee earnestly hope that a sufficient sum may be obtained through the valuable medium of the Press, to obviate the necessity of stopping, even temporarily, the work of repair. Subscriptions and donations will be gladly received by the Lord Bishop of Hereford, the hon. secretaries, or the rector, Abbey Dore.

## THE WEEK.

SECTION 13 of the first schedule of the Workmen's Compensation Act says:—"Where any weekly payment has been continued for not less than six months the liability therefor may, on the application by or on behalf of the employer, be redeemed by the payment of a lump sum, to be settled, in default of agreement, by arbitration under this Act, and such lump sum may be ordered by the committee or arbitrator to be invested or otherwise applied." The amount to be paid as a lump sum is indeterminate, although it is understood that originally the sum was not to exceed 312 times the weekly payment. A case came before the Manchester County Court this week which reveals the difficulty of complying with the section. A workman who was injured obtained an award of 10s. weekly against the Lancashire and Yorkshire Railway Company. It was asked that the sum should be commuted. Judge PARRY said it seemed to have been held by county court judges that the court should discover the actuarial value of the weekly payment and assess that as the sum to be paid. He did not think that was the right view. The word "lump" was not a common word in statutory language, and it suggested the ascertaining of a reasonable sum, and not the making of a more or less scientific calculation. An injured man would be better with 50% or 100% in his pocket than with 10s. a week, which, if he was a young man, might have a large actuarial value. On the other hand, the master could have no great object in capitalising his payments at their real value, and it was at the master's option, and his only, that the redemption could take place. The section was very vague, but he thought it was intended to meet a case where an injured workman wanted to make a start in life in some new trade, and the employer desired to help him. Thereupon if they could not agree on a lump sum—one must not lose sight of the word "lump"—the arbitrator came in to help them to find out what was just. In this case he did not see there was any good reason for fixing a lump sum. The workman was content, and on the whole his Honour thought things might well remain as they were, for if he fixed any sum at all it would probably be a larger sum than the company would desire to pay. At present, therefore, he did not propose to take any steps under the section. He was glad the case had been brought forward, for unless he was directed by the Court of Appeal to discover the actuarial value in such cases, his view of the meaning of "a lump sum" would be that which he had just expressed. The case will no doubt be brought before a higher Court, and it is time some definite conclusion on the subject was obtained.

THE name Philadelphia is enough to suggest general honesty; for what is brotherly love, if it can coexist with shirking mutual obligations? In that city, however, there is marvellous success in evading the payment of water rates, and it may be other rates also. It has been found necessary to make special inspections. Last year 248,226 premises were visited. It was discovered that in 40,418 of them, or nearly 20 per cent., water was used without any rent being paid. The irregular—that is to say, the dishonest—appliances numbered 70,660. The water rent chargeable to these fixtures amounted to 146,057 dols. The cost of the inspection was 26,448 dols., showing a net revenue to the city of 119,609 dols. Each succeeding year the city will gain the gross amount. It was in Philadelphia the "Declaration of Rights" was signed, which was the first draft of the Charter of the United States. The document seems a mockery when so large a part of the citizens are indifferent to some of the primary obligations of men when they live together.

THE annual convention of the American Institute of Architects will begin in Washington on Wednesday next, and will be continued during the rest of the week. Most of the papers to be read will have a local application. "The Improvement of Washington" will be treated by Mr.

DANIEL H. BURNHAM, Mr. FREDERIC LAW OLNSTED, jun., and Mr. CHARLES MOORE. There will also be papers on allied subjects, viz. "The Organisation for Municipal Improvements," Mr. W. B. DE LAS CASAS; "The Modern City," Mr. ALBERT KELSEY; "Improvements in London, England," Mr. OWEN FLEMING; "Water Effects in Landscape as Applied in St. Louis Exposition," Mr. E. L. MASQUERAY. Captain J. S. SEWELL, U.S.A., will read a paper on "The Relations of the Architect and Engineer." There will also be exhibitions of drawings and photographs illustrating the proposed improvement of Washington by the Park Commission, and of the competitive drawings for the new Municipal Building, Washington. Mr. C. F. McKIM will preside at the meetings.

THE French Academy would now be able to alter the old saying about the want of reverence in the sapeur, for there is alarm in all sections of the Institut not only about the operations for the improvement of the Rue de Rennes, but also about the undermining by the Paris Metropolitan Railway. Nothing is sacred to the navy, not even the Palais Mazarin, which stands on the site of the Hôtel de Nesle, and for which LOUIS LEVAU prepared the designs, which were realised under the direction of LAMBERT and D'ORBAY. A memorial has been sent to the Minister of Public Instruction calling his attention to the situation. It is considered that the passing of trains beneath the parts of the buildings used by the officials and for ordinary meetings is likely to affect the solidity of the walls, and, moreover, the noise will be a hindrance to the proceedings. In such a case what can a minister do but endeavor to compromise? Paris wishes to equal other cities in possessing an underground railway, and in order to gain that end the inconvenience to a few scholars is likely to be overlooked or minimised.

THE letter from Mr. JOHN HONEYMAN, R.S.A., relating to the Glasgow sewage scheme, which, financially at least, must be considered a failure, becomes the more remarkable when we remember how long a time has elapsed since he first brought his ideas on the subject before the public. In 1858 Mr. HONEYMAN read a paper before the Architectural Society of Glasgow on "The Purification of the Clyde and the Ventilation of Drains." At the meeting he exhibited a full-size drawing of a substitute for the old syphon trap of which the defects were recognised. The new trap was made by Messrs. BROWN, of Paisley, and was tested in several of Mr. HONEYMAN's works. But he did not patent it, from a delicacy about using it if he stood in that position. The late Mr. BUCHAN made a slight alteration, which was not, however, an improvement, and it is now universally known as the Somerset trap. In PARKES'S "Hygiene" the trap is mentioned as the only double-eyed trap then existing. Mr. HONEYMAN has therefore a claim to be heard on the subject of the drainage of Glasgow, and his condemnation of the action of the committee of the Corporation should be seriously considered by the people of that highly-taxed city.

ALTHOUGH in the Dublin Corporation much is said about economy, it is not always promoted in the most effectual manner. There is, for instance, an Englishman, Mr. H. H. HELLINS, who is resident engineer for the main drainage works, which are of so difficult a nature they were delayed for over thirty years. That he is an efficient officer is evident from the admission that he saved the people of Dublin about 15,000*l.* in the course of six months. For so responsible an office, and which must be considered as no more than temporary, a salary of 500*l.* a year is not exorbitant. Mr. HELLINS asked for an increase which would bring up his salary to that amount. On the plea that the Corporation is over-engineered, the members refused to agree to the request. It would not even be agreed to that any rise in the engineer's salary was desirable. Compared with other towns, the engineering staff of Dublin is arranged on an economical basis, but the true cause of the opposition is, we suppose, the nationality of Mr. HELLINS.

PAINTERS' ARCHITECTURE: BENOZZO GOZZOLI.

## PAUL BAUDRY'S LETTERS.

AMONG the French painters of the latter half of the nineteenth century there was not one who stood higher in the affections of his brethren than PAUL BAUDRY. A stranger who met him for the first time would be able to realise the reasons why men were attracted towards him. The impression he made was one of trustworthiness. His countenance, his bearing, his conversation gave the conviction that BAUDRY would be true to his principles regardless of the cost to himself, and that promises would be realised however much he might have to suffer. He was below the average height of his countrymen, but the manliness of his expression made one regardless of feet and inches, and it seemed as if RODIN'S bust in bronze was a more fitting representation of him than any portrait in oils. A native of Roche-sur-Yon he was a typical Vendean in whom loyalty was predominant.

The life of PAUL BAUDRY has engaged many pens, and those in quest of information about the painter will find what they desire in the volume which M. CHARLES EPHRUSSI has devoted to his friend. He exemplified the facilities which are offered in France to students of the humblest classes for their development when they are endowed with ability. He was the son of a *sabotier* who was also a musician, and his ambition was to see PAUL earning his living as a violinist. From nine to thirteen he went resolutely through monotonous exercises without his enthusiasm being excited. Then he was permitted to turn his attention to drawing. In remote towns artists who once dreamed of glory in Paris are sometimes glad to find a retreat, and fortunately for BAUDRY there was one of them in Roche-sur-Yon. His name was SARTORIS, and he had been a pupil of ABEL DE PUJOL.

He realised the lad's power, and endeavoured to secure a more successful career than his own for PAUL BAUDRY. He was able to persuade the local authorities—which is never a difficult task with a provincial maire or préfet—about their duty to aid so promising a youth. In 1844 the youth, who had not fully attained his sixteenth year, was despatched to Paris in order to win more glory for La Vendée. Like so many art students of those days, he began the campaign in DROLLING'S studio.

Students of art in Paris are allowed to play many pranks on each other, but they have a regard for the renown of their atelier, and when they see a promising comrade he is allowed to pursue the even tenor of whatever way he believes will lead to the goal, with its Prix de Rome. Those in DROLLING'S studio must have imagined, when BAUDRY did not carry off everything at the first attack, that the judges were jealous. After three years he won the second grand prix, then for two years in succession he failed, and it was not until 1850 that he attained the coveted prize. The subject that year was *Fishermen discovering*

*Zenobia, Queen of Samyria*, and BAUDRY'S work revealed academic influence, but at the same time he endeavoured to realise the scene as an actual incident. There was also a variety in the colouring which was unusual.

A new life then began for the artist of twenty-two, and by his aid we are enabled to have glimpses of it. One of his chums in DROLLING'S atelier was CHARLES MARIONNEAU, who has since adopted other pursuits, and is now a correspondent of the French Institut. He was a native of Bordeaux, and was blessed with a hearty southern temperament. To him BAUDRY revealed all his aspirations, and he began writing to him as soon as he won the Prix de Rome. The correspondence was continued for several years. The letters were entrusted to M. PAUL BONNEFON, and a selection from them has appeared in some numbers of *L'Art*. They form one of the most attractive records of artistic life which exist.

In 1850 the form of government was uncertain in France. LOUIS NAPOLEON was nominally head of a Republic, but few believed he would long accept that position. Old DROLLING at the dinner he gave to his prizemen proposed, "in a voice solemn and sombre," the simple toast, "A la République!" But BAUDRY had too important a task before him to allow himself to be led aside by politics. He left for Rome at the end of the year. There he devoted himself to study. But the news of the coup d'état alarmed him for the sake of friends. He implored MARIONNEAU never to expose himself to danger for the sake of a political idea. The world then appeared to him, as to Dr. PANGLOSS, as the best that was possible, and for an eager student the Villa de Médicis was an Elysium. But it was not long before he felt the need of money, in order to derive all the profit that was attainable from his sojourn. "I am lodged as a prince, that is to say, in a palace. I am fed like a cardinal, but there are holes in my hat." It was impossible to make ends meet on 75 francs a month, and to visit Venice, Naples and other parts of Italy would require 1,000 francs a year. BAUDRY was, however, soon relieved, for the Vendéans continued the subsidy, and, indeed, increased it from 600 francs to 1,300 francs.

He lost no time in travelling to Florence, not directly, but sometimes in diligence, sometimes on foot, in order to see as much of Italy as he desired. Among others in Florence were, at that time, LOUVET and LEROUTEUX, architectural prizemen, and BOUGUEREAU, now universally known by his paintings. BOULANGER had gone to Naples. At Florence he paid two pauli, or about 10s., a day for his chamber. His ambition was inflamed by the works of the masters. "I was thinking yesterday on leaving a gallery," he wrote to his parents, "about the glory and fortune which an artist can attain by means of a piece of canvas of a few feet square and some paint. Nothing more—a canvas

and an idea. And when the idea is grand, your name, however obscure, is grand and puissant as that of an emperor; even if you were only the son of a labourer like RAPHAEL, or the son of a woman who sold vegetables like EURIPIDES, one of the greatest poets of antiquity." Afterwards BAUDRY had to go through a process of disillusionising, and his notions about fame were modified. Then he recalled how little after all was known about the great masters. VASARI collected only a few anecdotes, and to some artists he was indifferent. After BAUDRY had completed his work in the Paris Opera House, what he sought was repose, not glory.

Before he returned to the Villa Médicis he had studied in Florence, Venice, Modena, Parma, Milan, Mantua, Padua, besides smaller places. He was glad to settle down to work in a fixed domicile. He contemplated painting two subjects, viz. the *Contest of Jacob with the Angel* and *Fortune with the Child who Slept on the Edge of a Well*. The second subject was suggested by LA FONTAINE, for whom BAUDRY had a true Frenchman's idolatry. Indeed, the fabulist became, as it were, a guide to him as a painter. He said afterwards, "It is with LA FONTAINE, with that charming spirit at once so natural and so Gallic, that I have toddled towards CORREGGIO, TITIAN and LEONARDO DA VINCI. I have not had the pretension to create; I am happy if I am able to remember." He toiled at the two paintings like a galley-slave.

He next made a journey to Naples. EDMOND ABOUT somewhere gives a delightful description of his meeting with the solitary "Little PAUL" in Pompeii, where the young painter seemed to be as happy as if he were in conversation with the old artists who had adorned it. ABOUT was a cynic, with an ambition to make literature a stepping-stone to political power, and he treated many subjects as if he were an epigrammatic statesman. Like the Englishman, he cared for nobody, and nobody cared for him. But there was one exception, PAUL BAUDRY, and the little affection he possessed he was always ready to bestow on him. About the time we mention the painter may have found a solace in Pompeii. The pictures he sent to Paris were subjected to the usual comments which are inevitable with contributions from the Villa Médicis. He was pained, but resolved to overcome the critics. Consequently he increased his ardour for study, and he spared no trouble to discover the causes of the success of the foremost Italians. His style was transformed. It was no longer suggestive of the fierce Gallic invader, but of the polished artist who avoided everything which might be taken as unrefined. He was not the first who was conquered by Italy, the enchantress.

We cannot follow all the stages of his career. It was recognised that he was a master of decoration who could infuse life into VESPER, AURORA, PHEBUS, and make the hours and seasons something more than abstractions. Commissions came to him from many quarters. For the Hôtel Galliera he represented the cities of Italy by typical figures which, at his desire, were published in *The Architect*. Prix de Rome men are loyal, and when CHARLES GARNIER obtained the commission for the Opera House he secured the most important part of the painted decoration for PAUL BAUDRY. It might be imagined that the painter had never executed any work except of cabinet size. He began a special course of education. BAUDRY spent the winter of 1867-68 in drawing from photographs of RAPHAEL's cartoons, and in the summer he came to London in order to colour his copies. Then he went to Spain to study the style of VELASQUEZ. He returned to Rome to renew his acquaintance with MICHEL ANGELO and RAPHAEL, some of whose works he had already copied. A visit to Venice followed. In spite of all his labour, perhaps on account of it, inspiration was coy. "I have eight large figures to invent and three great paintings for the *soffitti*. When are the visions of them to arrive? I cannot tell, and I dare not return to Paris until I have seized and fixed them on blue grounds like naturalists with butterflies." In his despondency, however, he had one consolation, for his brother, over whose education as an architect he had watched, had just obtained the first medal of the Salon for two architectural designs.

His friend MARIONNEAU knew that BAUDRY was likely to forget his own interests in so costly a method of study,

and seems to have remonstrated with him. The painter tells him how the account stands. He had finished twenty-two canvases for the Opera House. In order to complete the enterprise he went to Italy. At his own cost and without any subvention from the State he had painted three large ceiling pictures, one measuring 13 metres, or over 40 feet, and eight colossal Muses for the voussours between each painting. If he seemed to have deserted the Salon it was through devotion to the "grande peinture" with which so few artists occupied themselves, for success, and often fortune, are more likely to be assured by a small picture. In return he had the satisfaction of knowing that if glory arrived to him it was purchased by an entire neglect of profit. He made no solicitation, although he was elected a member of the Académie des Beaux-Arts, and he said his success was more owing to his paintings in the Hôtel Paiva than to those in the Opera House. BAUDRY was growing indifferent to renown, and he said he often implored the most brilliant journalists of Paris not to bore the public with "ma minuscule personne."

The outbreak of the war disarranged all his plans. When order was restored he resumed operations. To carry out some of the vast paintings he was obliged to use a loft at an inaccessible height in the Opera House. He was grateful to THIERS for his efforts, by which work of that kind was practicable, and as a testimony he presented the old statesman, who was as minuscule as BAUDRY himself, with the copies of RAPHAEL's cartoons he had completed in London. The paintings at the Opera House, with so conscientious an artist, never seemed to approach completion. It was in vain BAUDRY declined commissions or put prohibitive prices on portraits, with the resolution to sacrifice all his time to the work on which he had most relied to uphold the Vendean reputation for art. The canvases still demanded increased toil. At first he was assigned a part of the series, but he doubled the quantity without any increase of price. At length the end was in view, and then he found himself to be nervous and harassed, seeking only repose, cordials and covering, for the winter in the loft seemed to be Polar. He decided on exhibiting the paintings in the Ecole des Beaux-Arts for the benefit of a society for succouring painters. If there was any excess he proposed to ask a small share towards an asylum in his native place and for another artists' society. It is satisfactory to know that the exhibition was successful.

Free from his gigantic contract, BAUDRY was able to travel in Egypt and Greece with his brother, the architect. But his journeys made him prize France more than formerly, and especially the western parts. He was asked to design the diploma of the Universal Exhibition of 1878, of which a reproduction was printed in this Journal. Another national work was offered to him which was suitable to turn all his powers in a new direction. He was invited to paint the walls of the Panthéon with scenes from the life of JOAN OF ARC. His enthusiasm was renewed, and he was prepared to devote himself to it with as much indifference to his pecuniary interests as when he undertook the Opera decoration. To the end of his life it was his fondest dream. There were, however, material cares which were an obstacle to its realisation. He had to take up private commissions, but with all his productive power BAUDRY never allowed the supply of his works to equal the demand. He was the last representative of the connection between the Italian and French Renaissance; we might even say that in his works the identity of the two is accomplished. The explanation is to be found in one of his letters, where he says, "I live always as a student," and that was not only amidst surroundings that were poverty-stricken, but in thought, for he never ceased to look up to the Italians as if they were lawgivers who could have no modern rivals. If he had to grapple with the history of the peasant girl he might forget CORREGGIO, and France would have gained much. But his life will always be a reminder of a devotion to art which was sublime, and the letters in *L'Art* reveal that with all his labour he continued to be as cheerful and kindly disposed as old LA FONTAINE.

---

New Board Schools have been erected at Wigginton, Yorks, from the designs of Mr. W. H. Brierley, architect to the School Board.

## ENGLISH RENAISSANCE WOODWORK.\*

THE adaptability of wood for building was suggested by the ancient and general belief about the Greek temple originating in a timber hut. At a later time an example was given of what might be called the same human instinct when Sir JAMES HALL explained to the Royal Society of Edinburgh that the great Gothic churches were derived from the rustic dwellings of the north, and demonstrated how by driving posts into the ground and by tying willow rods to them a true Gothic arcade was formed. The theory was made memorable through its adoption by Sir WALTER SCOTT, who, as a master of woodcraft, was favourable to everything which increased the interest of trees.

There was one excuse for any extravagance of speculation about the relative merits of wood and stone as building materials, in the circumstance that neither could be supposed to have evolved a special style of construction or of ornament. Nor can it be said that in modern times with all our striving after originality we are much more successful than the builders of former ages. The delicate wood-carving of the French was imitated among us in a patented cement composition in the eighteenth century, and is now reproduced with the utmost fidelity in cast-iron. Indeed, it is common to see in a room the same old Roman ornament in a variety of materials, tiles, plaster, wood and metal. If we possessed a complete series of ancient Norwegian and Icelandic timber houses we might then observe an approach to a style that was emphatically dictated by the material. The master's high seat in the *skali*, or state-room, was said to be flanked by ornamental pillars or columns. There was carving in which dragons, or ling-worms, and other imaginary beings were elements, and scrollwork abounded. It would appear as if the stone carving, and sometimes the metalwork of the Northerners were derived from older examples in wood. We may also suppose that the early timber dwellings in Normandy and Brittany, as well as in England, must have had features which were likely to be traceable to the same source.

The examples shown in Mr. TANNER'S "English Interior Woodwork" are suggestive of the South rather than of the North. In the sixteenth century England was beginning to feel some of the influence of the Renaissance. The Classic style, however, suffered a "sea change" in transmission, and the details of English joinery will not sustain a comparison with those of the beautiful varieties of woodwork which are to be found in Italy. But at least in the examples selected by Mr. TANNER we must acknowledge there has been a restraint which did not allow of the extravagance which is supposed to characterise much of our Renaissance work.

The designers were obliged to fill their spaces with panelling. It will be observed in the plates now published that in arranging the panels right-angled forms were generally employed. Occasionally there are diamond-shaped examples and a few with arched heads, but it is rare to find an elliptical panel. Variety was obtained in the squares and rectangles by means of mouldings. They were not always easy to "run" in those days, but it is evident from many examples that it was realised that wood-working differed from stone-cutting by the facilities offered for having many mouldings in a limited space. The framing of the panels gave opportunities for introducing carved ornament instead of moulding, and then, as now, the egg and tongue appeared to find most favour.

In employing columns the Tuscan was the favourite, and it was often made the subject of a free treatment which must be admired. Next came the Corinthian. The Ionic was rarely utilised, and we see on those occasions the volutes, which are characterless if judged by Greek types, relegated to newels, balustrades, or terminals. Few figures are to be seen among the examples. A great deal of conventional ornament was in vogue at one time, and towards the close of the period illustrated GRINLING GIBBONS brought imitation to a perfection, or it may be to an excess, which was never surpassed. As WALPOLE said,

"There is no instance of a man before GIBBONS who gave to wood the loose and airy lightness of flowers, and chained together the various productions of the elements with a free disorder natural to each species." But disorder, although it may have its use, is out of place in architectural decoration.

The plates begin with two sixteenth-century screens from the Charterhouse, London, which are ornamented almost to excess. They are of the class in which "bits" of various kinds were used, probably without any definite plan of the whole. A fireplace from Ipswich is remarkable as belonging to a private house, but in detail it is also fragmentary, and we are told "the carved panels on the frieze are rather barbaric, and do not compare favourably with the more delicate design in the frieze to the panelling round the room." The judgment suggests that Mr. TANNER is not blindly idolatrous about his subjects. The entrance-hall of Hardwick has simple panels with a balustrade to the gallery, in which graceful vase-like forms are introduced. Some examples of staircases fill a separate plate. The panelling in the library of Merton College gains interest from age and position. But a little more variety would have been desirable, although it would have imposed additional labour on the artificers. Two examples from the South Kensington Museum show a combination of English and Italian treatment. A porch from a drawing-room, Broughton Castle, is interesting, and the object of it was, we suppose, to afford a means to display the armorial bearings of the owners.

Haddon Hall is always likely to be utilised as an example of English work. WALPOLE, in describing similar mansions, said:—"The apartments are lofty and enormous, and they knew not how to furnish them. Pictures, had they had good ones, would be lost in chambers of such height; tapestry, their chief movable, was not perfect enough to be real magnificence." In the drawing-room of Haddon Hall the panelling was only employed in the parts where there was no tapestry. All visitors to Hatfield House may not have observed in the long gallery that "unfortunately the panels to the great shelf are only painted on, which is inclined to give the whole composition a tawdry appearance."

Knole House is a peculiarly interesting subject, for besides early seventeenth-century work there is in the "Ambassadors' Room" an example of INIGO JONES'S treatment. There are a broken pediment, Italian borders of several kinds, Ionic pilasters, &c. Without the name of the designer, the elegance of the style would demand attention. As an example of florid Italian the staircase of Thorpe Hall, by JOHN WEBB, the pupil of INIGO JONES, is not easily matched. The only modern examples which resemble it are castings. There are other parts of the mansion illustrated which suggest the competency of WEBB to continue his master's style. WREN'S organ-case from Pembroke College does not express so well the Italian manner. His woodwork in the church of St. Lawrence Jewry, St. Stephen's, Walbrook, and Trinity College, Cambridge, Hampton Court, and Chelsea Hospital is far superior. It is evident also that GIBBONS co-operated with him, and the flowers and fruit are almost enough to compel an æsthetician to wish that so much naturalism was legitimate decoration. The ornament taken from Farnham Castle, if not by GIBBONS, was likely to have been executed by one of his assistants, for the swags have a similar abundance of fruits. The effort to combine horizontal and raking lines on the balusters is curious, but not entirely successful. There are enough balusters on the last page to be taken as models. Those from Burford Priory of a wavy pattern are light and sufficient to express that they form a screen, and, as they serve no constructive end, do not need to be massive.

The collection in Mr. TANNER'S volume is sufficient to suggest the English efforts to express Renaissance ideas in one division of building where utility and decoration are combined. The plates provide for a necessity in practice, as there is no book which brings together so many related examples, or is equally suggestive of the efforts made during a couple of centuries to deal with the same problems. By means of the work much time will be spared in hunting out examples for designs. The drawings are all to scale, with the exception of small sketches to indicate the

\* *English Interior Woodwork of the XVI., XVII. and XVIII. Centuries*: a Series of the best and most characteristic Examples of Chimney-pieces, Panelling, Staircases, Doors, Screens, &c. Measured and Drawn with Introductory and Descriptive Text. By Henry Tanner, jun., A.R.I.B.A. (London: B. T. Batsford.)

general effect, and can therefore be utilised without difficulty. For the purposes of study the plates can be taken in the order they are given, but for application the reverse course may be adopted with advantage, for JONES, WEBB and WREN had mastered the essential spirit of the Renaissance, and were more at ease in applying it than their predecessors.

### BRITISH SCHOOL AT ROME.

ON Saturday last a meeting of the committee and subscribers to the British School at Rome was held in the rooms of the Royal Asiatic Society.

The chairman (Professor Pelham) said that the School had hitherto lived under provisional conditions and a provisional government, which were to give way to a more permanent state of things. They all felt regret at the death of Mr. Spring-Rice, who as chairman of the committee had rendered great services both as a scholar and as a financier. Mr. Spring-Rice had died in the midst of a career of eminent public work, from which he had found time to help the endeavours in which they were engaged. He moved the first resolution, which was seconded and carried, "That all subscribers present who are not members of the general committee be added to the general committee."

The hon. secretary (Mr. William Loring) then read the report for the session 1901-2, in which it was said that the School was formally opened by Lord Currie, His Majesty's Ambassador to the Quirinal, on April 11, 1901. It had now terminated the first complete session of its existence as a working institution, and on the whole the results achieved were satisfactory. The Italian Ministry of Public Instruction extended to the students all the facilities which it was accustomed to grant to members of such institutions, and the official introduction to the authorities of the Vatican library had been effected through the kind offices of Cardinal Vaughan. With the other foreign Schools in Rome relations were of the most friendly nature. Special mention should be made of the kindness of Mgr. Duchesne, director of the French School, who secured for the School, from the French Minister of Public Instruction, a most valuable gift in the publications of the French schools both at Athens and at Rome. The committee also desired to express their appreciation of the assistance rendered to it by Lord Currie and the staff of the British Embassy, one of whom (Sir Rennell Rodd) had consented to join the committee. At the instance of the British Consul, Mr. Morgan, an informal conference was held at the Consulate in April last between representatives of the British School, of the Anglo-American Archaeological Society and of the British Academy of Arts, and it was hoped that with the British Academy of Arts, at any rate, some definite plan of co-operation might be framed. The rooms leased for the School in the Odescalchi Palace had proved to be well adapted for the purpose, but much remained to be done in the way of providing fittings and furniture. The committee had to acknowledge very gratefully the numerous gifts of books already received. Dr. Steele's munificent donation of books and bookcases was mentioned in the report issued to subscribers last January, as also were the grants made by the Universities of Oxford and Cambridge, and by the publishing firms of Messrs. Longman, Murray, Macmillan, Rivington, Methuen and Bell. Among the more valuable books presented by individual donors were the "Corpus Inscriptionum Latinarum," given by the Rev. S. A. Thompson-Yates; Forcella's "Iscrizioni delle Chiese di Roma" and Frazer's "Pausanias," by Mr. J. D. Paul; Eckhel's "Doctrina Numerum," by Mrs. Oldfield; a set of the publications of the Accademia dei Lincei (since 1898), by Dr. Thomas Hodgkin, and of the "Journal of Hellenic Studies" (since 1888), by Mr. J. C. Bailey. A copy of Duchesne's edition of the "Liber Pontificalis" had also been promised by the Rev. A. C. Headlam. The committee had also to thank the Palæographical Society for presenting the entire series of their publications. Thanks chiefly to these benefactions, the library now contained upwards of 1,000 volumes. The School opened with two students. One of these, Mr. Thomas Ashby, of Christ Church, Oxford, sometime Craven Fellow of the University, had continued to devote himself to the topographical researches in Rome and the Campagna, which had won for him a name; the other, Mr. Cuthbert Blakiston, also of Christ Church, and at present Craven Fellow, was occupied with the study of the architecture of the fourth century A.D. In addition to these two students, two others had been more recently admitted, Mr. Bernard Webb, who was sent out by the Institute of British Architects, and Mr. Peter S. McIntyre, who held a studentship from the University of St. Andrews for palæographical studies. The best evidence of the work accomplished by the School was supplied by the volume of "Papers of the British School at Rome," recently published.

Of the two monographs contained in the volume, that by the director (Mr. Rushforth) on Santa Maria Antiqua, was the only adequate account of the church as yet published, and was of great interest and importance. Mr. Ashby's paper was an excellent illustration of the work still being done, and to be done, in the Campagna Romana. The committee could not turn to the financial aspect of the affairs of the School without expressing their sense of the severe loss which it had suffered by the death of Mr. Stephen Spring-Rice, the hon. treasurer of the School. The audited accounts covered the period from October 1, 1901, to July 31, 1902. The receipts in the subscription account amounted to 478*l.*, and the expenditure was 536*l.*, showing a deficiency on this account of 58*l.* The donations amounted to 113*l.* It was obvious that strenuous efforts were still needed to put the School on a firm financial footing. The comparatively favourable results of the ten months' working were largely due to the subscriptions of colleges and other public bodies, which were only promised for short terms of years, and death had already begun to make itself felt among the individual subscribers. The committee were of opinion that the time had come when the constitution of the School should be placed on a more definite footing than had been the case hitherto. New rules had been modelled on those in force for the British School at Athens, with such modifications as the different circumstances of the two schools appeared to require. The general committee, having served its purpose, would be invited to vote its own dissolution, and the newly-constituted committee would report annually to the subscribers, as in the analogous case of the British School at Athens, with which it was hoped that the Roman School might ultimately establish an even closer connection than had yet been possible.

The Chairman said that it was clear that good work had been done, and he read an extract from a letter which he had received from Professor William Ramsay, of Aberdeen, who wrote that he thought very highly of the School's annual, which disclosed a unity, plan, order and purpose of which there was too often reason to regret the absence.

Mr. Mackail, in moving the second resolution, "That the report of the executive committee be adopted and that the rules submitted by them be confirmed," insisted that if the work was to be adequately done the directors of the School should be well paid; and, indeed, on such a sphere of operation two directors were really needed—one to preside over the department of ancient art and history, and the other over that of the Middle Ages.

Dr. Charles Waldstein, in seconding the resolution, observed that the continuity of history from ancient times and throughout the Middle Ages was better realised in Rome than on any other spot; and the Renaissance really centred in Rome. It was to be hoped that as there was already a student sent by the Institute of British Architects the full co-operation of that body and also of the Royal Academy would be secured.

This resolution having been carried,

Mrs. Strong moved the third, "That the general committee be dissolved," and expressed the belief that valuable results would be obtained from the papers issued by the School, which might in time rival those obtained by French and German scholars. The experience gained by our School at Athens would be of great value, and she ventured to think that many fine works of art in Rome, hitherto supposed to be copies, would turn out to be originals.

The resolution was seconded by Mr. A. H. Smith, and carried.

The last resolution, proposed by Mr. Hogarth and seconded by Mr. Hill, "That the President of Trinity College, Oxford, be elected chairman under Rule IX. (1); and that the following be elected members of the committee under Rule IX. (2):—Professor J. S. Reid, Dr. G. W. Prothero, Dr. C. Waldstein, Sir Rennell Rodd, Mr. A. B. Cook, Mr. F. Haverfield, Mr. W. Loring, Mr. G. A. Macmillan, Mr. A. H. Smith; that his Excellency Lord Currie, Dr. Thomas Hodgkin, and the Dean of Westminster be appointed trustees under Rule XXVIII.; and that Mr. Edwin Waterhouse be appointed auditor for the current financial year," was also carried.

### GLASGOW SEWAGE SCHEME.

THE following letter to the *Glasgow Herald* from Mr. John Honeynan, R.S.A., relates to the scheme which is now under consideration for dealing with the sewage of the city:—

The demand of the sewage committee for another million for the completion, or rather towards the completion, of their gigantic sewage scheme has aroused an amount of interest throughout the community which might have been evoked much more profitably six years ago, when it was still possible to prevent the Town Council from incurring such an enormous expenditure for such a trifling return. Even now it may be worth considering what sort of return we may reasonably hope for.

When the committee decided to ask power to borrow one million instead of the more modest sum recommended by their sub-committee, they gave as their only reason that this would allow the works on the south side of the river to be proceeded with at once, so that the great object of the undertaking—the purification of the Clyde—might the sooner be effected.

Now, assuming the purification of the Clyde to be the only outcome of this enormous outlay—the limit of which we have not yet nearly reached—it will naturally occur to most people who now see their direct interest in the matter, to ask, Is the purification, or the partial purification, of the Clyde in its course through Glasgow worth paying, say, 2,500,000*l.* for? This question, of course, ought to have been asked before; but even if it had been answered in the affirmative, and the citizens had agreed at least to spend, say, 1,000,000*l.* on the undertaking, they may well be excused if they feel both surprise and indignation when told that they have been committed to pay double that amount without their knowledge or sanction.

The frustration of Sir Samuel Chisholm's scheme, involving a cost of 750,000*l.*, was hailed with satisfaction by prudent citizens; but even that was quite a different affair from this. If prudently managed the 750,000*l.* would have yielded at least enough to cover the interest, and might possibly have resulted in profit; but the two millions, on the contrary, can result in nothing but dead loss from beginning to end; they must simply be a perpetual burden on the community, necessarily involving another, grievous to be borne, in the shape of annual upkeep and working expenses. And for what? I again ask. For a mere æsthetic fancy, a thing which not one-fiftieth part of the population will be able to appreciate, or, indeed, know anything about, and which will be of no material advantage to anyone. No one probably will venture to deny that to burden a city with a debt of over two millions sterling to obtain for an insignificant fraction of the population a hypothetical benefit so intangible must be regarded as at once absurdly extravagant and extravagantly absurd.

It may perhaps be urged that the proposed change will affect beneficially the health of the city, but there are good grounds for believing that that is merely a fond delusion. The idea that the river as it is is a source of danger to the health of the city was long ago demonstrated to be false. More than forty years ago, during one of those periodical scares which induced our Town Council to spend many thousands of pounds on reports by eminent engineers, a well-known Glasgow architect, in a paper which was published at the time, called attention to the fact that when the vital statistics of districts having the same class of inhabitants were compared it was found that the death-rate in the districts nearest the river was invariably lower than in those further removed from it. More recently, the careful observations regarding the purity of the air in different parts of the city under the direction of the late Dr. Angus Smith, explained this circumstance by proving that the purest air was found to be under Glasgow Bridge, and the next purest at the harbour, near the Sailors' Home. If anything else was needed to clear the much-maligned river it will be found in the declaration of Sir William Gairdner, in the course of the discussion on Dr. Smith's paper, that "it was impossible to prove that the impurity of the Clyde was a cause of disease or death."

It would thus appear that we cannot regard this huge sewage scheme as a sanitary measure. There is, indeed, some reason to fear that its effect may ultimately prove to be of an opposite character. This appears to have been the view of the President of the Architectural and Engineering Section of the Aberdeen Congress of the Royal Institute of Public Health, who, in his opening address, referring to this point, says that unless special measures are taken to prevent it, "it may prove to be not beneficial but detrimental to the health of the community." Also that "the effect of the change will merely be to substitute the great intercepting sewer for the river as an outfall for the lateral sewers, and it may be doubted if this substitution will be a sanitary improvement, for it seems evident that the open air and sunshine over the broad surface of the river is much more favourable for the development and attenuation of noxious germs than the comparatively close and damp atmosphere of a subterranean sewer."

In view of these facts, the miserable attempt of the sewage committee to account for the extraordinary discrepancy between the estimate of cost and the amount actually spent up to date, and the uncertainty which naturally prevails as to the discredited committee's estimate of future expenditure and the sufficiency of the proposed loan, Mr. W. F. Anderson's proposal to delay operations on the south side in the meantime appears to have much to recommend it. This course would have many obvious advantages, chiefly:—(1) The experience gained in the construction and working of the western section might be turned to good account; (2) the committee would have plenty of time to get reliable estimates of the cost of the southern works; and (3) it would still remain an open question whether the work on the south side should be carried out as designed, modified or abandoned.

The sum now asked for may be sufficient to complete the entire scheme, but we cannot be certain of that till the western section is completed and in working order. If, when that is done, a sufficient amount remains to complete the work on the south side, good and well; but I think it exceedingly unlikely that the citizens of Glasgow will submit to further taxation, during this generation at least, for the completion of a scheme so extravagant and unproductive.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

A MEETING of this Association was held in the rooms, 117 George Street, on the 26th ult., Mr. A. Hunter Crawford, the president, in the chair. After some formal business the President read a paper on "The Heating of Buildings by Steam Vapour." He discussed the warming more particularly of domestic buildings, pointing out the following disadvantages in the usual system adopted with the low-pressure hot-water system which, while excellent in many ways, was unsightly:—(1) The large size of pipes and radiators which it required; (2) its cost; and (3) its liability to be injured by frost. Attention was drawn to the method of heating commonly adopted in Germany. This was distinct in many of its important details from the low-pressure system largely used in America, and recently adopted somewhat freely in this country. The principal points in the former system were the working of the steam boiler at a pressure of only half-pound per square inch, the complete automatic control of this pressure, the entire absence of air-valves on the radiators, the use of only one valve for admission of steam to the radiators, and the fact that this valve could be opened to any extent desired, giving complete control of the amount of heat given off by the radiator. The attention of heating engineers was specially drawn to the system because of its extreme simplicity in working, its security from injury by frost, its easy control, and its suitability for placing in houses in a way so as not to be at all an eyesore. Mr. Crawford illustrated by sketches the details of the apparatus, and at the close he was awarded a cordial vote of thanks.

## CLASSICAL ASSOCIATION.

THE first general meeting of the Classical Association of Scotland was held in Edinburgh on Saturday, under the presidency of Professor G. G. Ramsay, LL.D.

Professor Baldwin Brown read a paper on "Some Archaeological Aids to Classical Study." He displayed a number of photographs of ruins and statuary, drawings of coins and various maps and diagrams illustrative of ancient Greece and Rome, and pointed out how these might be used to give a living interest to the literary studies of the pupils. Combined with archaeology Classical studies would develop upon lines that would render still more potent for good their humanising and elevating tendency; faculties left untrained by a purely literary education would be developed, and a substantial concession would be made to the scientific spirit by incorporating upon Classical work some of the methods which gave educational value to the pursuit of natural science.

Mr. J. F. White, LL.D., in proposing a vote of thanks to Professor Baldwin Brown, said the art of Greece had done as much for the world as the literature of Greece. He mentioned that a scheme was on foot whereby Aberdeen would be provided with the best museum of Classical sculpture in Scotland.

Professor Butcher, in moving that the chairman be thanked for his address, said the coincidence of Germany and America encouraging Classical studies was peculiarly significant, particularly as the two countries quite independently had arrived at the same result. This country was in danger from that superficial reform which under the name of reform was reaction—from the idea that they were to begin with purely utilitarian specialisms and get rid of the wider basis of education, which took time and trouble. The mistake made by the advocates of modern languages in this country was twofold—the commercial people wished to teach modern languages only for the immediate object of the shop, and scientific people looked upon modern languages merely as an instrument in the teaching of science. Once they got the conception of a study that it was to be worked at merely as an instrument enabling them to get on to some other subject, the whole dignity and value of the study was lost. From the first he had advocated the giving of the option which now existed in the University between modern languages and Greek. All he contended for was that, if modern languages were to be taught as an alternative to ancient languages, they should have a dignity of their own and be treated as branches of study which were worthy of leading up to academic study and not merely leading into a commercial house.

## RICHMOND HILL.

AT the meeting of the London County Council on Tuesday the parks committee presented a report in connection with the former negotiations with Sir Whittaker Ellis for preserving the amenities of the view from Richmond Hill. It was pointed out that the properties at Twickenham, known as Cambridge Park Gardens and Haversham Grange, which are within the view from Richmond Hill, are at present owned by Sir Whittaker Ellis. Recently the Cambridge Park Gardens property was offered for sale by auction, but was bought in. The owners of these two properties and of Meadow Bank adjoining to the westward are under covenant each with the other not to build in advance of a certain line. It was the desire of the committee that an agreement embodying this covenant should be scheduled to the Act of Parliament authorising the purchase of Marble Hill; but they were not able to obtain the consent of the owners of the properties to this course in sufficient time to enable this to be done in the Bill then before Parliament. In October, 1901, Sir Whittaker Ellis wrote forwarding a plan showing the line above referred to so far as his properties were concerned, and stating that he would undertake not to build below that line provided the Marble Hill property were retained as an open space. He afterwards wrote stating that if the Marble Hill estate and such other adjoining properties were secured by the London County Council as would, in their opinion, preserve the view from Richmond Hill, he would be quite willing to give such undertaking as the Council might desire that the land he held on the opposite side of the river, being Cambridge Park Gardens and Haversham Grange, should not be further built upon than at present, except conservatories or other buildings of that nature for garden purposes. When, however, Cambridge Park Gardens were recently offered for sale, there was no reference in the conditions of sale to restriction of building other than the covenant with the adjoining owner. On Sir Whittaker Ellis being asked to cause an announcement to be made in the auction-room that the property would be sold subject to the undertaking he had given not to build upon it, he replied, "I certainly never contemplated binding the property in other hands than my own, and of course it will now be for any purchaser of the property to deal with the question." The committee are advised that Sir Whittaker Ellis can be required to enter into the undertaking indicated by his letter, and accordingly recommend the Council to pass a resolution to the effect that such steps as may be necessary be at once taken for the enforcement of the promise, and generally for the protection of the Council's interests in relation to the view.

Captain Swinton pointed out that, in regard to the recent auction of some of this property, Sir J. Whittaker Ellis had gone back on his undertaking not to build.

Colonel Rotton declared that the Council would never have voted one penny for the purchase of the Marble Hill estate had they known that Sir Whittaker Ellis took up the position he now did.

Mr. Torrance took the same view, and said that in this matter the committee had been led into a trap. They had done all they could to come to terms with Sir Whittaker Ellis, but had found it impossible.

Mr. Piggott pointed out that counsel's opinion had been taken, and it was upon that that they were proceeding.

The recommendation of the committee was unanimously adopted.

## PUBLIC BUILDINGS IN NEW SOUTH WALES.

IN his last report to the Department of Public Works of New South Wales, Mr. W. L. Vernon again remonstrates about the policy of neglecting to provide an adequate sum for the conservation of public buildings. He says:—

It is impossible to avoid again calling serious attention, even at the risk of tedious repetition, to the unsatisfactory condition of the large number of buildings, both metropolitan and country. The vote to cover these necessary services, owing to political and other exigencies, is yearly diminishing, while at the same time the number of buildings is increasing, their dilapidations are more apparent, and the occupants are constantly pressing for necessary additions and improvements.

It was strongly urged when the estimates were being prepared, with Federation in view, a special sum should be granted me to place the post-offices of the colony in a good state of repair and efficiency by the time that Federation should be accomplished. In the result, however, this schedule of buildings has had to be dealt with in the hand-to-mouth fashion as all others have, with the consequence that unless a considerable sum of money and very exceptional efforts are made during the forthcoming year, the buildings will be taken over in anything but a state creditable to the colony.

To show more clearly the tendency of the policy of the Government, I have prepared the following statement showing the gradually decreasing percentage calculated on capital

expenditure now available to cover not only repairs, but also improvements. In a previous year's report I expressed it as my opinion that owing to climatic conditions, a sum equal to 2 per cent. per annum on the capital value was necessary to provide against deterioration and a moderate amount of improvements. Fixing therefore 2 per cent. as the datum, it is by no means satisfactory to read the statement, which is as follows:—

Year.	Vote. £	Capital Value of Buildings. £	Percentage of Expenditure. £ s. d.
1889	70,000	3,801,130	1 16 10
1890	65,000	3,834,464	1 13 10½
1891	65,000	3,930,741	1 13 0½
1892	62,000	4,037,233	1 10 8½
1893	23,350	4,081,058	0 11 5½
1894-95	46,000	4,134,223	1 2 2½
1895-96	41,000	4,219,853	0 18 5
1896-97	32,000	4,322,879	0 14 9½
1897-98	37,423	4,393,712	0 17 0½
1898-99	38,750	4,462,000	0 17 4½
1899-1900	19,020	4,693,312	0 8 1½

In the foregoing statement the following buildings only are taken into consideration:—Courthouses, police buildings, post-offices, gaols, institutions for insane, public buildings generally in the metropolitan district; and is exclusive of hospitals, benevolent asylums, custom-houses (country), lands offices (country), public parks and gardens and buildings therein, miscellaneous.

The following extracts from reports of district architects emphasise my own opinions upon this subject:—

Mr. Lewis, of the Orange district, states:—"The public buildings in this district do not receive the attention in the way of painting and repairs that they undoubtedly should. They are generally allowed to go upwards of ten years without being touched, while I have an instance in which the building has not been painted for the last nineteen years. Old paint is allowed to perish and woodwork to show signs of decay before fresh paint is applied, and repairs are not effected until about three years after recommendation. To place the whole in proper order would cost about 3,000*l*. During the year just closed I have been permitted to expend only 430*l*."

Mr. Boissier, Goulburn, writes:—"The buildings in this district are in the following state—twenty-three in good order, thirty-nine in fair order, twelve in bad order, eighteen needing repairs and painting. Of the above twenty-three have not been painted for periods ranging from eight to over ten years, and about thirteen others for from six to eight years."

Mr. MacTaggart, of Albury, states:—"About 40 per cent. of the buildings in this district have been renovated during the past five years, the balance have not received attention from that up to ten years and over, and in several cases the buildings have become extremely dilapidated owing to want of painting and repairs at reasonable intervals. In one case a sum of 250*l* is now required, whereas what is necessary at the proper time could have been achieved by two sums of 50*l* each expended during the past ten years, thus showing an unnecessary expenditure of 150*l*."

Mr. Macgregor, Cootamundra, writes:—"I have to report that the condition of public buildings in this district is very unsatisfactory, a fact strongly evidenced inasmuch that 75 per cent. of them have not had proper attention in the way of repairs, and are in many cases in a bad state of repair; 30 per cent. of the buildings have not been painted for the last eight to ten years."

Mr. Castleden, Tamworth, reports:—"The public buildings in Tamworth are in a good state of preservation, not so those in other centres of the district, a large number of which have not had proper attention in the way of repairs and improvements."

Reference is made in this report to buildings which have not been painted externally for ten years.

Mr. Fitzgerald, Grafton, states:—"I have to report on the necessity of large expenditure necessary to keep the public buildings of this district in proper repair. One-third of the buildings have not received proper attention, and of the remainder about one-half require external painting."

He also furnishes a somewhat long list of buildings that have not been painted during the last ten years.

The Churchwardens of the parish of Isleworth have decided to rehang the famous peal of bells at the parish church, originally cast at the Whitechapel Bell Foundry 135 years ago. According to reports of experts the bells are much worn by the clappers and require quarter tuning. Unless they are rehung there is some risk of their cracking, owing to the clappers striking too near the edge. A fund has been opened to cover the cost of rehangng.

## NOTES AND COMMENTS.

THE removal of the contents of the library from the Palazzo Barberini to the Vatican occupied a fortnight. The utmost care had to be taken of manuscripts and early printed books which the POPE had acquired by the payment of a large sum of money. There are, it is believed, over 50,000 volumes and 8,000 manuscripts. Among the latter the most valuable are those in Greek. A work written on parchment dated 1321 contains drawings of ancient monuments and is evidence of the attention given to archæology at the time. SAN GALLO, the architect, added several drawings by himself to the collection. At least twenty manuscripts of DANTE are there, some with fine miniatures. TASSO is largely represented, especially by notes on Greek authors. The Barberini Library was collected between 1635 and 1640 by Cardinal FRANCIS BARBERINI, the nephew of URBAN VIII. A large number of documents relate to that Pope's pontificate.

AN exhibition of plates and drawings by DANIEL CHODOWIECKI has been opened in the Wallraf-Richartz Museum, Cologne. He deserved notice, for he may be said to have been the German HOGARTH. It was supposed to be complimentary to ADOLF MENZEL, who by many is considered to be foremost of modern illustrators, to designate him the new CHODOWIECKI. He was a native of Danzig, where he was born in 1726. When seventeen he became bookkeeper to his uncle, a shopkeeper, who, among other wares, sold snuffboxes of his own production. CHODOWIECKI was employed to adorn them with paintings, which he copied from prints. In the course of a few years he tried his hand on miniatures, but eventually he took up etching. He is said to have produced a couple of thousand plates, most of them being intended for the illustration of books. Among the authors he served were RICHARDSON, the English novelist, SHAKESPEARE, BURGER, VOSS, GOETHE, SCHILLER. His dramatic scenes are of interest in a historical sense, for he endeavoured to show what he saw in the theatre, and the costume and scenery are suggested. He was a realist. His representations of FREDERICK THE GREAT and his courtiers are accepted as faithful. Like HOGARTH, he aimed occasionally at reform. The extent of the appreciation of CHODOWIECKI is suggested by his appointment as director of the Royal Prussian Academy of Art. He died in Berlin in 1801.

SLATES from Newfoundland have found a ready sale in the English market. This has given much hope to the colonists. Professor HOWLEY, the director of the Geological Survey, says he was surprised at the activity seen at the quarry in Smith's Sound. A fine pier was in course of construction along the water front, being filled in with the waste from the slate. Vessels of almost any size could lay alongside within a stone's throw of the quarry and in perfect safety. A large space immediately in the rear is used for storage purposes, where a display of slate lay piled in tiers awaiting shipment. About fifty men were busily engaged with Ingersoll steam drills quarrying huge slabs from the cliff. These were swung by derricks on to trolleys in waiting and quickly moved to the sheds, where a number of Welsh slaters were busy cleaving and dressing the material into the required dimensions for roofing purposes. The slates are made in two sizes—20 by 10 and 24 by 12. Sandstones and limestones are abundant. In addition serpentines of many varieties and great beauty are met among the magnesian group or metamorphic series, wherever the latter attain any considerable development. A very beautiful green variety of an attractive appearance, admirably suited for ornamental purposes, comes from Tilt Cove in the vicinity of the copper mines. Many kinds of soapstone exist in connection with the serpentine deposits, and beautiful ornamental stones may be encountered in various parts of the country, such as red, yellow and variegated jaspers, amethystine and opalescent quartzite, handsome porphyries, syenites, traps and amygdaloids, and a variety of other minerals. All that is said confirms the conclusions of BEETE JUKES, who was the first to reveal the mineral wealth of Newfoundland.

A SIGN has been added to the collection by deceased artists, to be seen in the Hôtel de Ville, Paris, along with examples by living competitors. It is by the painter of the *Angelus*, JEAN FRANÇOIS MILLET. It was produced during the period when he was among the crowd of students in PAUL DELAROCHE'S atelier. Although only about twenty-two, MILLET had had probably a more varied experience than any of the young artists around him. He had not only studied with provincial artists, but he also had toiled as a farm labourer, and for a time managed his mother's farm. His family belonged to a village near Cherbourg, and it was in the latter place he began the systematic study of painting. The sign was painted for a veterinary surgeon at Cherbourg, and for long was affixed to the premises. The subject was a horse in a field, and the execution shows that the artist was well acquainted with animals. The picture is the more remarkable because, although MILLET devoted himself to country scenes during the latter part of his life, he preferred peasants to quadrupeds of all kinds.

AMONG the old buildings in Tonnerre, in the department of Yonne, is a part of the large hospital which was founded in 1293 by MARGUERITE DE BOURGOGNE, the sister-in-law of St. LOUIS. There are not many examples of its class existing. The large salle was lighted by lancet windows. The beds were arranged in two rows along each side, and the centre was vacant. The roof was not vaulted, but carried by large beams, which testify to the size of the trees then growing in France. A statue of the queen is found on her tomb. The capaciousness of the great hall has induced the municipal authorities to propose the conversion of the hospital into a covered market. It was to meet such vandalism the Commission of Historic Monuments was established, and it would be a blow to archæology if the members failed in their duty on this occasion. The hospital of Tonnerre is not the oldest in France, but since the destruction of the Hôtel Dieu in Caen is the best example which has survived. It is also remarkable because of the wide space which was made available without the aid of piers.

## ILLUSTRATIONS.

RIVER PLATE HOUSE, FINSBURY CIRCUS, E.C.

CATHEDRAL SERIES: HEREFORD.—EAST WALL OF SOUTH TRANSEPT.

NEW STABLING AT WARLINGHAM.

NEW FIRE BRIGADE STATION AT EAST GRINSTEAD, SUSSEX.

STATIONERS' HALL, LUDGATE HILL: THE BOARD-ROOM.

THE Stationers' Company can be considered as more fortunate than the majority of the other trade guilds in London, for a revenue is derived from the registration of books and various publications. The origin of the Company might be regarded as an experiment in Inquisitionism during the reign of Queen MARY. The members formed, as it were, an Index department on a small scale, for they were empowered to seek and destroy books which they assumed to be not sufficiently orthodox. There was also a privilege to print certain books, almanacs being one of them. The last relic of the monopoly was the useful "British Almanac and Companion," the "Companion" being originally a rival publication by CHARLES KNIGHT. It could not be said there was a severe supervision exercised by the Company over their own productions. A heavy fine was once imposed by the Star Chamber for an omission in an edition of the Bible. By giving a commercial character to the Company in supplying capital there were more successful results. Some of the members left substantial sums to increase the general property. Whether the Company serves any useful purpose has been disputed, for it is believed by many lawyers that the system of registration does not confer the protection which is desirable.

## PORTRAIT PAINTING.

A COURSE of lectures on portraiture has just been delivered in Dublin by Sir Walter Armstrong, the director of the National Gallery of Ireland. In the first lecture, according to the *Irish Times*, it was said that the ostensible purpose of all portrait painting, the task, at least, to which all portrait painters were invited, was essentially the same. They were not called upon to produce works of free art, creations on which the expression of their own intimate æsthetic selves was modified solely by the nature of the material. The portrait painter was invited to submit his own individuality to that of another, to do his utmost to make immortal one who possibly might be unsympathetic to himself. Such a task was not an easy one. It demanded, in fact, the highest powers of the artist. A great portrait need not shrink from the rivalry of any plastic creation. If, in their minds, they reviewed all the great painters of the world, putting aside those who deal exclusively with landscape, they should find only two whose possible masterpieces were not portraits—Michel Angelo and Correggio. These two were the great conspicuous exceptions which gave a point to the generalisation he had ventured to make. It would scarcely be going too far to assert that the most faultless production of every other prince of art was a portrait. From the point of view of rank and dignity, then, the subject yielded to no other open to the student of art. For those who loved and understood the art of painting the subtle differences between one masterpiece and another would be an inexhaustible source of pleasure. As a preliminary to explaining what it is that makes a good picture, the lecturer sketched and illustrated by examples of work the normal development that takes place in the artist's mind between the day when he first enters an art school and the day when at last he finds himself able to create. The various processes or steps were divided roughly into three stages, in the first of which the work was purely imitative. In the second stage the artist's work gave evidence of "arrangement." The young artist was not content with imitation, but prefaced it with manipulation of the things to be imitated. The last stage in the evolution of an artist was that in which it dawned upon him that his business was not to imitate, but to make—that nature was a means to a picture and that he never must subordinate the interests of the latter to those of the former. The last thing the young painter learned was the expressive power of the material in which he worked. Before bringing this lecture to an end he wished to say the little that need be said of antique portraiture.

*Ancient Portraits.*

The portraits that had come down from what used to be called the early ages of the world were no doubt numerous enough. They were also profoundly interesting from certain points of view, although they were not in the great majority of cases the result of desires similar to those which had governed what they meant by portraiture. Most of them, again—nearly all, in fact—were in some material less readily damaged by time and accident than any form of paint. The only exceptions of any moment were the coloured statues which had come down to them from the early dynasties of the Pharaohs, such as "The Scribe" in the Louvre, which contain the arts of the painter and the sculptor. Examples were to be seen in the greater museums and galleries. The National Gallery in London has eleven. Apart from these sporadic hints at what they had lost, antique portraiture had come down to them in the works of sculptors. The Egyptians, the Assyrians, the Chaldeans, the Greeks and the Romans all preached iconic sculpture. Among the finest things they possessed were the portrait figures in wood and limestone from the ancient and the middle Empires of Egypt. The "Wooden Man of Boulak," "The Scribe," and the numerous figures of servants, agricultural labourers and dwarfs, tradesmen, and so on, which had been drawn from the cemetery of Memphis to people the Cairo Museum, would be remarkable at any time and in any country. The astonishing thing about all this Egyptian sculpture was that the older it was the finer was its art. Speaking broadly, Egyptian art as we know it embodied long and gradual decadence from the culmination which occurred, perhaps, 6,000 years before the Christian era, in the days of those Pharaohs who built the pyramids of Ghizéh. If it took thirty centuries for Egyptian sculpture to decay, how long did it take to climb up to the greatness it had reached before the first glimmering taper of history began to make visible the darkness of the past? The comparative chronology of early Chaldean sculpture was still so unsettled that nothing definite could be said as to the art of Egypt. The few remains which had so far been discovered were nearly all in the Louvre, and consisted of a series of headless figures found at Pello, or Lower Mesopotamia, between 1876 and 1880. A few isolated heads were also found which had a peculiar interest of their own on account of their affinity in type to the Chinese. That affinity became extraordinarily suggestive when taken in connection with the fact that the earliest Chaldean written

characters had so much in common with ancient Chinese writing that they had enabled European scholars to decipher Chinese classics even in cases where the Chinese themselves were at fault. The Assyrians bore much the same relation to the Chaldeans, their predecessors in empire, as the Egyptians of Thebes did to those of Memphis, or the Greeks of the Roman Empire to those of Periclean Athens. Their activity was greater and their output more copious, but they had lost truth of observation, sincerity of feeling and delicacy of execution, so that the portraits they turned out in such numbers had very little individuality. Even in the sculpture of the Second Theban Empire in Egypt they were able to recognise individuals. Such recognition was hardly possible among the Assyrians. The oldest Assyrian monument yet discovered dated from the twelfth century before Christ, when all the civilisation of the two great valleys—those of the Nile and the Euphrates—had substituted material ambitions for the expression of sincere artistic emotion. Among the Greeks and their vigorous but vulgarised echoes things took a different course. In the great days of Greek art, portraiture for its own sake was almost unknown. A private patronage gradually superseded the patronage of the State; portrait sculpture increased enormously until it formed the larger part of the whole. But even then it did not become portraiture in the modern sense. Its aim was not so much to grasp character and preserve it, to note personality, and hand it down to posterity, as to generalise and lay stress upon the attachments of an individual to his kind—to produce, in short, a type modified by an individuality. Even so the Greeks were not great portraitists. The really fine busts and statues are very rare. The British Museum has a good bust of Pericles by Cresilas, Lord Leicester one of Thucydides at Holkham. Those of Alexander are numerous and sometimes good, though never so fine as portraits struck on the coins of his successors. The best of the full length statues were those of the dramatists Sophocles and Euripides, of the orator Demosthenes and the poet Posidippus. Before each one felt that their production was not entirely governed by the spirit of portraiture, but that, perhaps, higher spirit of idealisation which had presided over Greek art almost from the beginning. With the Romans portrait statuary was no doubt founded on that of the Greeks, and a great deal of it the work of Greek brains, but its inspiration was somewhat more modern. The best Roman portraiture—he might say the best Roman art—was to be seen in the great series of Imperial busts with which the older European museums are filled. He might instance the well-known busts of Julius Cæsar, of the Emperor Pertinax, the Empress Crispina, all in the British Museum. He instanced the greatest, perhaps, of all Roman portrait statues—the seated figure of Agrippina, with its beautiful drapery, in the Capitol of Rome. They might think, perhaps, that he had passed over antique portraiture in too rapid a fashion. It was impossible to discuss it exhaustively in one of a series of lectures like these. The ruling aim of the Greek or Roman artist was seldom, if ever, portraiture pure and simple. His object was to hold up a name to glory, the applause of contemporaries and the admiration of posterity, and not to reproduce an individual with all his qualities or defects. His ultimate intention was in no sense to leave a document for the information of historians and biographers, but to do for his patron in a suitably modest fashion what Phidias did for Zeus, or Praxiteles did for Aphrodite. If, in many cases, he did produce a fine portrait, it was rather adventitious than essential, and rather by way of making sure that there should be no mistake about the identity of his patron.

*Italian Portraits.*

In his second lecture Sir Walter Armstrong said their subject was the portrait making of Italy during its greatest and most famous period. The movement which they called the Italian Renaissance began, as they were aware, with the revival not of the plastic arts, but of learning. After sketching briefly the origin of the Renaissance, and its effects first on architecture and afterwards on sculpture, he pointed out that the Italian Renaissance was not the isolated movement they sometimes imagined. Between the inauguration of modern Italian (as distinguished from antique) fine art by Nicola Pisano, about 1230, and the first appearance in the peninsula of the particular branch of art with which they were at present concerned, something like two centuries elapsed. The first modern portraits, in the sense in which we now understand the word, were those records of their own personal appearance which the early sculptors and painters were so fond of introducing into any work which they expected to bring them credit. The first Italian portrait painter in anything like the modern sense of the word was Antonello da Messina, who was probably born about 1444, three years before Botticelli, and nearly forty years before Raphael. Antonello saw from the works of Van Eyck what fine things could be done in portrait and in the hitherto despised method of painting in oil and varnish. Fine as Antonello's work was, his chief importance lay in the stimulus he gave to his contemporaries.

In the generation which preceded the full development of art in Italy, the work did not greatly differ from that of Jan Van Eyck. The lecturer then discussed those men who carried the art to the highest development of which it was capable. The first man to sound the possibilities of its depths was Leonardo da Vinci. Before the end of the fifteenth century he had painted various portraits, of which only one could be traced—the panel in the Louvre, which might fairly be called the most famous of all portraits, the *Mona Lisa Giocondo*. The story goes that he spent four years over the portrait, and then left it unfinished. He had called the *Mona Lisa* the first modern portrait, because it was the first to make the expression of an individuality the ruling vote of an æsthetic conception. Leonardo had seized upon *Mona Lisa's* character, had taken it in action so to speak, and made a really felt emotion dominate his scheme. He had combined life with repose in a way approached by no artist anterior to himself, and by very few since his time. It is not too much to say that in the *Mona Lisa* a phase of vitality was first made to govern an artistic design. The effect in Italy was instantaneous. The frankest admirer was Raphael himself. He made a drawing, now in the Louvre, which is almost a copy of the *Mona Lisa*, and from this drawing he painted a famous portrait, now in the Pitti Palace at Florence. The *Mona Lisa* was finished with the fifteenth century, and the flush of perfection which immediately began to spread over Italian portrait painting dated from the first decade of the sixteenth. Raphael never quite shook himself free of Leonardo's domination. The hands of the *Mona Lisa* especially seem to have been his school; they were the standard of what hands should be, and of how they should enforce a personality, and their character was echoed curiously in everything he did after about 1508. Raphael, as they knew, was the culmination of the school to which he belonged. After referring to the work of several of Raphael's pupils, which, he said, represented not a climax continued, but the beginning of a decadence, the lecturer said that in Venice the first man to produce a portrait in which they could admire the full power of art was probably Giorgione—he said probably, because, as a matter of fact, this artist's works were so much in dispute that it would scarcely be fair to tell them that any existing portrait was certainly by him. The dates were not quite certain, but in all probability Giorgione was Titian's senior by above twelve years, and the probability that Titian was only eighty-eight, and not within a few months of his hundredth birthday when he died, would justify the claim of Giorgione, who was born not later than 1477, to be considered the first Venetian painter in whom the full bloom of the late Renaissance showed itself. They might take as representing Venetian portraiture during the sixteenth century Giorgione, Titian and Tintoretto. The Venetian painters had betrayed their love for colour very early in the fifteenth century, so that when the genius of Giorgione met the achievement of the early Paduan, Florentine and Bolognese masters he had only to crown it with Venetian splendour to create an art which has no equal in its own way. The finest Italian school of portraiture was that of Venice in its flower. Since it disappeared the art has flourished in the Low Countries, in Spain, and in the British Isles, and in them all the influence of Venice is to be found.

#### *German, Dutch and Flemish Portraits.*

The third lecture related to "German, Dutch and Flemish Portrait Painters." Sir Walter Armstrong introduced his subject by explaining that portraiture, as we know and think of it, began, not in Italy, where it first touched perfection, but in the Low Countries. The creator of the art was the younger of the two Van Eycks. The example set by Jan Van Eyck had a great effect in his own country, as well as in the distant peninsula beyond the Alps. Albert Dürer, born thirty-one years after the death of Van Eyck, breathed a new life into German art. He was a Hungarian by extraction, but it was possible that the German Leonardo, as they might call him, was by blood a Magyar. He was one of the most inquisitive of all artists. His portraits were thoroughly Germanic in conception. The second great German was Hans Holbein. He proposed, as he had made the two greatest of Germans stand for the German school as a whole, to take F. Hals and Rembrandt as representatives of Holland and Rubens and Vandyke as those of Flanders and Brabant. Now, while the German portrait painters were as objective as they knew how to be, suppressing themselves and stating the facts with a curious mixture of intelligence and patience, the Dutch and Flemings took a diametrically opposite course. Hals, Rembrandt, Rubens and Vandyke each and all used portraiture for the declaration of their own æsthetic predilections. This they did to such an extent that one sometimes felt in danger of losing the sitter under the artist. To these four men and the school to which they belonged art was the essential matter, while facts to be recognised were accidents clinging about it. The Germans reversed the order, the facts with them coming first and art slipping in behind as a sweetener.

It was, of course, all a matter of degree, of proportion, between one ingredient of a picture and another. But these proportions were so differently understood by the two schools that the products of the one were cut off, as with a knife, from those of the other. Hals, the first of the great Dutchmen to mature, was older than Rembrandt by nearly a generation. He was solely a portrait painter, although some of his portraits were so conceived that they would do for fancy pictures too. Rembrandt was perhaps the most concentrated artistic personality of whom they had any record, and was the last to appear of the twelve great painters who rose like spires over the artistic history of the sixteenth and seventeenth centuries. After his tentative period it is easy to see that he never sets out to realise the hopes of a sitter. His interest is excited by some pictorial problem, some combination of light and shadow, line and texture for which the client will give the opportunity. In his very early years, before he was twenty-five, Rembrandt's inspiration was really iconistic. At last one feels that he looks upon his sitters as models, pure and simple, pegs to hang his own personal conceptions on. Rubens, born in Westphalia in 1577, and his pupils were next discussed, the greatest of them being Anthony Vandyke. These great artists of the Low Countries were all men of strong individuality. Rubens sacrificed much to the rendering of exuberant vitality of the life which seemed to radiate, as heat does from the sun, from his abundant men and women.

#### *Spanish and French Portraits.*

The subject of the fourth lecture was "Spanish and French Portrait Painters." It was said that the historian of art had to face few more difficult questions than that of the early growth of the French school. So far as he knew, there were only two questions connected with modern art—with art more recent than that of the ancient Greeks and Romans—which presented more difficulties. These two were, of course, the origin, extent and comparative importance of the art which flourished in this island during the dark ages, and the place which should be occupied by English art in a history of Europe during the Middle Ages. The general art movement of Northern Europe during the twelfth, thirteenth and fourteenth centuries—a movement in which the gifts and energies of the French people were the most important factor—had never yet been properly appreciated. In many cases the happiest of the contributions to the early artistic movement were made by the inhabitants of a district about the size of Ireland, of which Paris was the centre. After explaining the connection between this early form of art and the architectural requirements of the times and districts in which it flourished, he found in the arch the background, if he might call it so, on which all the arts were embroidered during the centuries which immediately preceded the irruption of the Italian Renaissance from the south. Having discussed the character of the work done by Jean Perréal and Fouquet in introducing Italian ideals into France, he said that, unfortunately, the Italianising influence was not good for the French painters. Many of those who worked under the domination of Italian ideas became famous, but none produced work which could rank with similar things being done in other parts of Europe. The work of the two Clouets was discussed, and it was pointed out that they were what in England were called limners. After Janet's death came a long unsatisfactory period in French painting generally. What was wanting was sincerity. Of course there were exceptions, such as the two Poussins and Claude in the seventeenth century, and Watteau and Chardin in the eighteenth—the two latter personalities being among the most original in the history of art. The painter of Louis XIV. were miserable creatures—to use a phrase of Carlyle. In Spain they found a very different evolution. There the Gothic wave broke against the traditions of the Moors, and before it had thoroughly exhausted itself, had to submit to the further modifications brought about by the infiltration of Italian ideas. In no country in the world were more charming results produced by the combination of Gothic with Renaissance form than in Spain. As an instance of this work the lecturer cited the choir of Toledo. The Inquisition, or rather those constituents of the national character which made the Inquisition possible, pressed heavily on the plastic arts. From the middle of the sixteenth to the end of the seventeenth century a stream of good portraits issued from the Spanish studios. After discussing the limitations which resulted from the Spanish view of women, he pointed out that the first of the great Spanish portrait painters was Coello, who had been described as the Velasquez of the Court of Philip II. Next to Coello came Theotocopuli, known as "Il Greco," who was said to have studied the school of Titian, but judging from his style it was much more likely that Tintoretto was his master. Velasquez, the greatest of the Spanish painters, was almost contemporaneous with Vandyke. He was essentially a portrait painter, and must rank with Titian, Rembrandt, and Holbein as one of the four greatest portrait painters of the world. After noticing the

work of Murillo, the lecturer pointed out that the last great Spaniard was Goya, who died in 1828. During the eighteenth century, when Goya alone was adding to the artistic treasures of Spain, French painting was showing signs of renewed sincerity. Watteau lived to add a new feature to the art of his country. After him came Chardin, who began to do for the society in which he lived what the Dutchmen of the seventeenth century had done for those of Amsterdam and The Hague. In the second half of the century Greuze and Madame Le Brun were both real artists in their way. The French Revolution profoundly affected art. Classic models alone were accepted, and painters were expected to work in the spirit which might be taken as that of the Roman studios. David was the leader of this phase of French art. The last representative in France of the ideas which governed the classical of the Republic was Ingres.

#### *British Portraits.*

On Saturday the last lecture of the series was given. The subject was "British Portrait Painting."

Sir Walter Armstrong explained that modern painting, using the word modern in its most restricted sense, is founded mainly on the example of the English painters of the eighteenth century. The differential physiognomy, the collection of characteristics which will enable a connoisseur of, say, the twenty-third century to distinguish at a glance between a picture produced during the nineteenth century and one of the seventeenth is founded on the example set by Hogarth, Reynolds, Gainsborough, Constable and other natives of the British Isles between 1750 and 1820. Modern European painting was seen to have taken off, if he might use such a phrase, from what was being done in London in the days of George III. Discussing the beginnings of English portraiture, the lecturer said that the earliest portrait we can point to in England is that of Richard II., which hangs in the choir of Westminster Abbey. It had been called Venetian, Sienese—anything but English—and yet there was plenty of evidence to show that England at the end of the fourteenth century, when this picture was painted, had artists quite capable of such a work who may well have spent some of their pupilage in Italy. Between the painting of this picture and the next portraits of any merit which England could claim came the Wars of the Roses, and the still more destructive era of the Reformation. Between the reign of Richard II. and that of Henry VIII. English portraiture is chiefly represented by a few heads of kings, rough copies mostly of originals which go to prove that the paramount influence in these islands during the fifteenth and early sixteenth centuries was that of travelling painters of Flanders and Brabant. The earliest group of English portrait painters to reach any high degree of merit was that which made its rise in the studio of Holbein. At least two of Holbein's assistants—Strete and John Bettes—were men of remarkable ability, but unfortunately we know very little of either. Discussing art during the Elizabethan period, the lecturer pointed out that two-thirds of the portraits were ascribed to Frederigo Zuccaro. From the beginning of the sixteenth century to the middle of the seventeenth the distinctive school of English portraiture was that of the miniaturists. Isaac Oliver, Peter Oliver, Nicholas Hilliard and John Hoskins formed a quartette to which we owe a splendid illustration of the men and women of the courts of Elizabeth and James I. After them came one of the greatest and most original of all portrait painters, although his works seldom exceeded a crown piece in size. This was Samuel Cooper, whose miniatures are among the determining causes of the form taken by painting in England for more than a century. After pointing out that Vandyke's English art was chiefly taken from Cooper, he argued that it was not unreasonable that the English should claim a share of the distinction of Vandyke, and argue that if Vandyke had never come to London he would never have done anything, so kingly and elegant as the Charles I. which they had seen on Thursday. Still Vandyke's was the chief external force in deciding the line to be taken by English art for the century which followed his death. The patronage of foreign artists and the work of Peter Lely were next discussed, the lecturer urging that, on the whole, Lely deserved his triumphs. Having reviewed the work of Greenhill, John Riley and Godfrey Kneller, the latter of whom practically monopolised English portraiture between Lely's death in 1684 and his own death in 1723, the lecturer pointed out that the distinctively English school of art, and, speaking more generally, the sentiment and practice of art which still existed in modern Europe, dates from Hogarth. Before Hogarth died he may possibly have realised that a new era had dawned for English art. Reynolds and Gainsborough had both begun to attract attention, and the author of "Marriage à la Mode" may have seen these pictures at one of those exhibitions which foreshadowed the founding of the Royal Academy. Reynolds and Gainsborough were the two great names in art of the eighteenth century. Gainsborough had the finer genius, but Reynolds the gift of

thought. When Gainsborough's inspiration was at its best, he could reach heights never quite obtainable by Sir Joshua. There was nothing in the work of Reynolds which could bear without damage the juxtaposition of such things by his rival as the Mrs. Sheridan at Tring Park, or the "Blue Boy" at Grosvenor House, or the Lady Mulgrave, or the Mrs. Robinson in the Wallace Gallery, or the "Morning Walk," or even the Mrs. Siddons in the National Gallery. In these there was a force which was beyond Sir Joshua. The lecturer showed twelve of Gainsborough's portraits in order to bring before his audience the best type of the eighteenth-century portrait painting, which was, he said, so important in the English school. Among these was the picture which led to Gainsborough's quarrel with the Royal Academy. The third of the great English trio was Romney, although some would substitute Hoppner's name for his. Hoppner was not such a striking personality as were Gainsborough, Reynolds, and Romney. Romney afforded the most striking instance of the way in which an artist's fame may fluctuate. After his death his pictures were sold for such prices as 15s. to 2*l.*, but now the possessor of a very fine Romney had to pay 50*l.* a year for the privilege of having it on his walls. Romney was inferior to both Gainsborough and Reynolds as a colourist, nor could he compare with either in vivacity and force, but in design and the felicity with which his lines swept about the canvas, he excelled them both. His sense of female beauty was greater than Sir Joshua's, and about equal to that of Gainsborough, while his execution had a simple directness almost without parallel in the English school, or indeed anywhere else. Next to these three came the Scottish master, Sir H. Raeburn, born in 1756. Neglected by connoisseurs and collectors, it was left to loan exhibitions to rescue his work from obscurity. After the death of Raeburn in 1824 portrait painting sank to a low ebb in the British Isles. Lawrence was the only man of distinction, and he died in 1830. For ten years there was no portrait painter who was really an artist, with the exception of John Constable, the great master of landscape, who during his later years indulged in his old pursuit. After Constable's death in 1830 we got so close to our own time that generalisation became dangerous. Future generations might find in some of the men who were at work during the early years of Victoria a charm which was invisible to the present generation. The lecturer having glanced at the work of contemporary artists, including Watts, Millais and Sargent, said that he had to ignore the miniature painters who flourished at the junction of the eighteenth and nineteenth centuries. No nation in Europe had equalled or even seriously rivalled the English in the mingled dignity and charm of their miniatures. In any review of the great art of portrait painting the work of Richard Cosway, of George Englebert, of John Dowman, of Horace Hone, of the two Plimers, of the three Robertsons, of Samuel Cross, and, above all, of John Smart, who combined sympathy and breadth of treatment with minute finish in a way that put even Gerard Dow to shame, would have to be taken into serious account.

At the close of the lecture the Dean of St. Patrick's thanked Sir Walter Armstrong for his admirable addresses, and congratulated the College on securing his services as lecturer, and Sir Walter Armstrong briefly replied.

We are indebted to the *Irish Times* for the foregoing excellent reports.

#### MANCHESTER ROYAL INFIRMARY.

A PRIVATE meeting of the new board of management of the Manchester Royal Infirmary was held on Monday. Mr. John Thomson presided. At the meeting held a week ago it was suggested by the chairman that it would be necessary to obtain a distinct offer from the Owens College Council with regard to the site in Stanley Grove, and that any conditions which might accompany the offer could then be fully considered with the plans before the Board. At the meeting on Monday two committees were appointed. One committee is to report upon the legal position of the trustees with regard to the Piccadilly site before entering upon negotiations for the sale of it. The other committee is to inquire and report (1) whether the Stanley Grove site is the best available, and (2) if so report fully regarding that site, and the portions of the estate allotted to the Southern Hospital and the Cancer Pavilion and also upon the property adjoining. These committees will proceed to work at once and submit their reports to the Board at as early a date as possible. The Chairman read a letter from the Principal of the Owens College formally offering the Stanley Grove site for a new infirmary. The total area of the property at Stanley Grove is 12 acres 2 roods and 27 perches. The Cancer Hospital occupies 7,573 yards, and the Southern Hospital authorities have a covenant to build within a few years on land which extends over 12,176 yards. The committees are not expected to report fully before another month has elapsed.

### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE preliminary examination, qualifying for probationership R.I.B.A., was held in London and the undermentioned provincial centres on November 4 and 5. Of the 163 candidates admitted, 54 were exempted from sitting and 109 were examined, with the following results:—

Centre.	Number Examined.	Passed.	Relegated.
London . . . . .	61	39	22
Birmingham . . . . .	13	10	3
Bristol . . . . .	5	3	2
Leeds . . . . .	10	7	3
Manchester . . . . .	13	10	3
Newcastle . . . . .	7	6	1
	109	75	34

The passed candidates, with those exempted—129 altogether—have been registered as probationers.

The intermediate examination, qualifying for studentship R.I.B.A., was held in London and the undermentioned provincial centres on November 4, 5, 6 and 7. Ninety-eight probationers were examined, with the following results:—

Centre.	Number Examined.	Passed.	Relegated.
London . . . . .	67	40	27
Bristol . . . . .	5	3	2
Glasgow . . . . .	6	5	1
Leeds . . . . .	7	2	5
Manchester . . . . .	13	4	9
	98	54	44

The final and special examinations, qualifying for candidature as Associate R.I.B.A., were held in London from November 14 to 21. Of the 49 candidates examined, 20 passed, and the remaining 29 were relegated to their studies. The following are the names of the passed candidates:—

R. Bennett, W. E. Brooks, F. B. Chester, W. St. L. Crowley, W. Greenwood, J. H. Higson, J. Holt, H. J. B. Hoskins, J. I. P. Jones, J. M. Lethbridge, T. F. MacLennan, C. E. Monro, G. S. Nicol, C. E. L. Parkinson, H. T. Rees, N. T. Salmon, S. Towse, W. H. Watkins, H. White, F. C. Wrigley.

The following shows the number of failures in each subject of the final:—

I. Design . . . . .	23
II. Mouldings and Ornament . . . . .	23
III. Building Materials . . . . .	14
IV. Principles of Hygiene . . . . .	12
V. Specifications . . . . .	8
VI. Construction, Foundations, &c. . . . .	13
VII. Construction, Iron and Steel, &c. . . . .	16

The Board of Examiners recommend that the Ashpitel prize be awarded to Mr. William Greenwood, of Blackburn (probationer 1900, student 1901), he being the candidate who has distinguished himself most highly in the final examinations of the year.

### THE "PALACE OF HENRY VIII."

IN the early part of 1901 the London County Council purchased the freehold of the ancient building, No 17 Fleet Street, which was reputed to be the palace of King Henry VIII., with a view of preserving the historical portions from destruction. The demolition of the entire building had been decided upon, and the Council deserve credit for rescuing and retaining the unique ceiling of the council chamber and the original front of the house, which has for many years been hiding behind a mask. During the last fifteen months the business of the proprietor, Mr. John Carter, has been carried on in the old council chamber of the Duchy of Cornwall in days of James I. The first part of the contract, however, is complete, and two saloons are now open. The County Council will shortly proceed with the front part of the building, and will take down the historic ceiling and panelling in the council chamber and remove them to South Kensington; there the restoration will be taken in hand under the supervision of Sir Purdon Clarke. He is of the opinion that the ceiling, with its saracens' heads and other plaster reliefs, is the finest specimen of the kind that he has seen. When finished they will be returned to Fleet Street and will be replaced in their original positions in the council chamber. The County Council have arranged that the public shall have access to this piece of old London.

The front of the house, which now overhangs the pavement, has been found to be a false one masking the original. This front will in rebuilding be removed and the original, consisting of carved oak pilasters and other attractions, will be restored to its original beauty and replaced.

The shop-front will be set back about 5 feet and the upper part thrown out on cantilevers to overhang the pavement. This work may occupy some months, but when finished the

building will form quite a landmark within a few yards of where Temple Bar stood, and will continue to be one of the permanent attractions of Fleet Street.

### AMERICAN RENAISSANCE.\*

CIVILISED man and especially one of Anglo-Saxon descent is a home-loving creature. To him the dwelling-places stands for his most important institution. The arts, sciences and traditions he pursues mainly as they are to minister unto it, and its fruition is the goal of life. About this dwelling-place, then, there must be a very great deal to be said, indissolubly associated as it is with everything in life worth having—one's childhood, parents, children, wife, sweetheart, and next to these one's own personal comfort—one's hours of leisure and recreation. Therefore, just so much as Domestic architecture departs in an impersonal, artificial way from whatever relates to or reflects these associations, just so much does it err—does it fail. It will be obvious upon a moment's consideration that any cold-blooded practice or discussion of academic formulæ alone, looking to the development of American Domestic architecture, is hopelessly futile and inefficient.

The home one builds must mean something besides artistic and engineering skill. It must presuppose by subtle architectonic expression both in itself and in its surroundings that its owner possessed, once upon a time, two good parents, four grandparents, eight great grandparents, and so on, had, likely brothers and sisters, uncles and aunts, all eminently respectable and endeared to us, that *bien-séance* and family order have flourished in our line from time immemorial—there were no black sheep to make us ashamed—and that we have inherited heirlooms, plate, portraits, miniatures, pictures, rare volumes, diaries, letters and State archives to link us up properly in historical succession and progression. We are covetous of our niche in history. We want to belong somewhere and to something, not entirely cut off by ourselves as stray atoms in boundless space either geographical or chronological. The human mind is a dependent thing, and so is happiness. We may not indeed, have inherited the house we live in, the chances are we have not. We may not remember that either of our parents or any of our grandparents before us ever gloried in the quiet possession of an ideal homestead; but for the sake of goodness—for the sake of making the world appear a more decent place to live in—let us pretend that they did, and that it is now ours. Let us pretend that God has been that good to us, and that we have proved worthy of His trust. With this much of psychological preparation, I believe it is possible for every cultivated American man or woman to approach the subject of American Renaissance architecture—Domestic architecture—in the true spirit of understanding.

By American Renaissance I allude to no "American style." That much abused term "American style," which so frequently crops out in treatises upon architecture, were you to follow it up would be found to signify, as a rule, merely American non-sense and aberration. And I suppose there is no nation which may show such an imposing array of architectural non-sense as the United States during the last brief 50 years of their independence. Certainly no nation has evolved a national style of architecture, intentionally, as is being constantly urged upon American enterprise. Such a thing could have no historic value, while it could not escape being vulgar and monotonous. Characteristic architecture is a dead slow development, and although there have been building epochs of remarkable activity, in none is the progress appreciable from year to year. American Renaissance differs from that of other countries only as it has been affected by the local conditions and requirements of America. Good modern Renaissance—regret there is a sight of building that is bad—is very like good-breeding, pretty much the same the world over, differentiated only by local colour or custom.

The predominant local colour which distinguishes American Renaissance has been given to it by what has been our great national building commodity, *i.e.* wood. The Greeks and Romans built of stone when they had the money to pay for it as does everybody else; otherwise, people in new countries fall back upon a less expensive material. Our less expensive material was wood. Both stone and wood have grain, and have to be used with the same careful regard to it. Whether we build our columns up of stone or wooden sections—latitudinal in the one case, longitudinal in the other—to support a cornice also constructed in sections according to the convenient size of commerce for the particular material, makes no difference to the canons of art so long as we are not trying to deceive or to imitate one material with another simply with that end in view. It is extremely doubtful if our American ancestor

\* From an article by Joy Wheeler Dow, architect, in the *Architect and Builders' Magazine*, of New York.

were ever guilty of premeditated deception. Their material was an honest material, it had to be fashioned in some way, why not after the manner of the Renaissance? In our own day of numerous shortcomings in matters architectural it rarely enters the head to deceive upon this point. Notwithstanding the tremendous resources now at command, we yet prefer wooden columns to stone ones for dwelling-houses. As national wealth has increased, however, there has been that natural tendency, of course, to carve the Renaissance details of stone, and the white marble porches of Washington Square, North, may be cited as splendid bits of American Renaissance. But if we go further, and by reason of accumulated affluence erect the entire structure of the new Colonial house in stone—columns, cornices, window and door casings, &c., strange to say we lose an indefinable charm—a certain warmth and personality with which American history has invested wood. Besides, the fashion and style of Renaissance motive and detail is as suitable to wood as it is to stone; and if the former material is not quite so durable it is much more easily repaired and replaced.

In English Renaissance, local conditions commonly restricted the use of wood to the interiors. In American Renaissance, the plenitude of this material enabled the Colonial builders to use it for the outside as well, and with great advantage, for it permitted the colonist to elaborate the elevations of his dwelling, gaining thereby warmth, cheerfulness and grace, and all easily within his means. Without the slightest danger of bankruptcy he could proceed to embellish the curtilage with arched gateways, ornamental fences, terrace rails and summer-houses *ad lib.*

Had America been settled and colonised two centuries earlier under a Tudor king, most likely there would have been a Gothic influence in the early work. It is difficult to know in our day how it could possibly have been exploited in wood, and there is no excuse for our attempting anything of the kind at this time of unlimited resources in the building trade. Battlements, keeps and moats were feudal protectory measures, and would have been worse than useless constructed of anything inflammable. About the only legitimate Gothic architecture expressed in wood which has stood the test of time is represented by the seventeenth and eighteenth-century chalets of Switzerland, and I doubt if even Yankee ingenuity could have evolved anything half so good. As a matter of fact we have no ancient Gothic exemplars. It is said that the old Pickering house on Broad Street, in Salem, built A.D. 1649, was a replica in wood of a Jacobean tavern in England, namely, the Peacock inn, Derbyshire. The venerable dwelling at Salem has passed through many vicissitudes, and in 1842, when the influence of John Ruskin was so misused in America, the Pickering house was largely remodelled, so that it is impossible to say to-day how successful an adaptation of Jacobean work this was. But even Jacobean architecture is scarcely Gothic architecture, since England incorporates it with all the rest of her Renaissance.

Sir Christopher Wren was supreme upon the architectural stage of England when the prosperity of the American colonies was sufficient to warrant the academic study of Domestic architecture upon this side of the Atlantic, and Sir Christopher was the very life of the English Renaissance in its stricter sense. During this great history-making epoch the giant forests of America came into excellent play for following out—if often in a crude and kind of miniature way—whatever the prodigious architect executed in stone. There was no bit of Classic detail from either Athens or Rome transmitted to London through what I may call the Florentine Clearing-House presided over by Palladio, Sansovino, Scamozzi and their contemporaries, but what it could be carved more readily in wood, and time and history have thrown a glamour over all this wooden development of ours, and established its right of succession with a hall-mark.

But the main point in favour of Renaissance architecture must be remembered was that it lent itself extremely well to the Anglo-Saxon home feeling. It emanated from a land that had reached the pinnacle of attainment in the arts of peace, Italy, and it was so easy to fashion and make minister to most Anglo-Saxon home requirements. Luckily the colonial builders were conservative artificers, neither so clever or so restless as this generation, or they certainly could not have resisted the eloquence of false prophets and knavish architectural promoters and fakirs who came their way. For thus we would have been deprived of our illustrious inheritance, which apply cannot be taken from us now.

Fortunately for American architecture Sir Christopher Wren was what we would call in our vernacular, "all right." He had a good thing, an inexhaustible mine for supplying ideas for all manner of buildings, and he worked it for the best interests of all concerned. His reputation and success has created many a modern, would-be Wren to dare to try the experiment of some rival kind of architecture. Such is the aspect we have now of the late H. H. Richardson and his Romanesque style.

Trinity Church in Boston was a superb design when it was finished, and continues to be so to-day. But its best influence, I fear, has been perverted for ever. A quarter of a century ago Richardson was hailed as an apostle equal to Wren, and America went mad not in a Romanesque revival but in a carnival of it, by which I mean to say it was burlesqued. It is sad to reflect that such a genius as the man who designed the church in Boston should have allowed himself to succumb to the wiles of the flatterers enough to be drawn into the disgraceful saturnalia which followed so close upon his brilliant debut.

Now the home of the Romanesque was not Florence. It pretended to nothing of the court of Lorenzo the Magnificent, which, if it stood for anything, was elegant living. Mediæval, benighted south of France was the home proper of the Romanesque, and its proper medium of expression, churches, cloisters and monasteries. What could such a style of architecture contribute to the Anglo-Saxon home? Absolutely nothing. And when Trinity Church was finally completed Richardson had practically exhausted everything there was in the newly borrowed style. He could have gone on, probably, raising ecclesiastic edifices, designing an occasional library or two in good form without directly cribbing from his masterpiece; but neither he nor his imitators—and they were legion—cared a fig for the ethics or proprieties of architecture. They appear to have been actuated alone by the same principles of expediency which govern the "new art" movement. They invented an exaggerated architectural grammar without doubt derived from the old monasteries in the south of France, but so vulgarised as to establish a clear case of libel for those eminently respectable prototypes. This grammar the rabid reformers proceeded to apply to every kind of secular building in America, finally, to American dwelling-houses themselves. They did not reckon with their grandparents for an instant, not they. They apparently took the keenest delight in walking rough-shod over every sacred home memory. They openly insulted the very ancestors to whom they owed existence. But the balance of good and evil there is in the world cannot be disturbed so suddenly or arbitrarily. Outraged history was not slow to assert itself, and after a while would have no more of "Richardson Romanesque."

#### SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on Monday evening, December 1, Mr. Percy Griffith, president, in the chair, a paper was read on "The Depreciation of Plant and Works under Municipal and Company Management," by Mr. Charles H. W. Biggs.

The author commenced by observing that the question of municipal and companies' accounts, and especially depreciation, had been largely debated of late, and though non-technical, the subject might have some interest to the members of a technical society. The designs of engineers, especially such as required the use of iron and steel, played a considerable part in the question of depreciation, in that the life of the structure in which those materials were used depended upon the life of that part of the material used according to the factor of safety adopted. He pointed out that there was a tendency among modern engineers to use too low a factor of safety, which meant a higher rate of depreciation than when a higher factor was adopted.

The debt of the local authorities of this country, he said, was now about 300,000,000*l.*, which, at 3½ per cent. per annum, meant about 10,500,000*l.* a year for interest. The whole of that capital was obtained upon the condition that a certain definite part must be repaid annually. That capital was expended upon two classes of work, non-productive and so-called productive, the latter producing a revenue, though not necessarily a profit or a loss. He observed that the most obvious charges upon an undertaking were:—(1) Interest; (2) repayment of capital; (3) depreciation; (4) maintenance, and (5) working. Item 3 had been the most severely criticised of all the charges, and it was held by a very influential and numerous class that, in addition to maintenance and repayment, depreciation was absolutely necessary to place municipal undertakings upon a sound financial basis. He would assume the undertaking to be a tramway. If maintenance meant keeping the works efficient out of revenue, and depreciation as well as repayment was required, then revenue must earn during the period over which repayment extended a threefold equivalent of capital. The author pointed out that depreciation as applied to municipal undertakings was not founded upon a logical principle. Repayments extended over an arbitrary period, decided by a government department, but usually the period was in his opinion too short, and the rates of repayment therefore too rapid. As at present carried out, it imposed far too heavy a tax upon the first users for the benefit of subsequent users.

Companies' capital, he observed, should, for the purposes of comparison, be considered independently of the question of promotion money, or watering or any of those incidental deductions that really took place in practice, in which case the whole of the capital was available for the cost of the work. That capital remained constant, but careful examination would show that, revenue being sufficient, it was repaid as in the case of a municipality, though the period of repayment might be different. Thus, he would take the interest on gilt-edged securities as a standard rate of interest, and assuming that to be 3 to 3½ per cent. per annum, and assuming that 6 per cent. per annum was the amount necessary for dividends, he thought that we surely might look upon any dividend over 3 or 3½ per cent. as equivalent to the repayment of the loans in the case of a municipality. That it had not been so considered up to the present time was no proof that it was not so. If the company provided adequately for depreciation its revenue might then be split up in the same way as that of a municipality, viz.:—(1) Interest; (2) repayment; (3) depreciation; but with this difference, the company would get all the revenue possible, while public opinion would compel a municipality to pay more consideration to users in regard to their charges. That a threefold tax was imposed on users might be seen from actual examples. Aberdeen in four years paid to sinking fund 3,380*l.*, to depreciation and renewals 6,774*l.* Bolton had paid 16,397*l.* to sinking fund account, and 32,596*l.* to depreciation and renewals account. In conclusion, the author observed that an examination of further figures showed a lack of uniformity, but it abundantly proved that, under the existing system, the revenue had to be maintained at an excessive rate to the detriment of the present users.

#### GLOUCESTERSHIRE ENGINEERING SOCIETY.

THE annual meeting of the Gloucestershire Engineering Society was held on the 25th ult. at the Municipal Schools, Gloucester, when the president (Mr J. D. Humpidge, M.I.M.E.) presided over a good attendance of members.

In the course of his presidential address Mr. Humpidge gave a brief review of the advance made during the past few years in the many different departments controlled by mechanical engineers, and in other branches of engineering intimately connected with them. The President said that everyone nowadays was agreed as to the importance of keeping oneself well up-to-date in all that was going on, and indeed the only way to advance was to be well posted in what other people were doing and then try and "go one better." English engineers had been accustomed for such a long time to consider themselves easily first in their profession that they had been a little inclined perhaps to rest on their laurels while other nations had been advancing, with the result that they now found their position of proud supremacy threatened if not actually taken from them. They had had plenty of proofs of this; they had American locomotives running in our colonies, and even on some of our railways, and many of the orders for engines, bridges and material required for our colonies were going to the same country or to Germany. The fastest passenger steamers in the world were built or belong to Germany, and with many of them their own workshops showed only too plainly that in machine tools the Yankees had in many directions got well ahead of them. What was the remedy? People had told them they would never get on unless they adopted American methods. Such advice was all very well, but those who offered it forgot that to adopt it would simply place them on a level with those they imitated. What was required was something more than this. Let them study the methods employed in America, Germany or elsewhere, and then, aided by their own experience and the knowledge thus obtained, let them try and strike out in improved methods, never forgetting that he who imitated never got level with the one who originated, and it was only the first in the race who won. It could never be too thoroughly remembered that the vast development in engineering work that had been going on in recent years, and which was still going on at an ever-increasing rate, was producing a most important change in the conditions under which engineers had to work. In olden days an engineer had comparatively few customers, and for those customers he had to carry out practically everything they required in the way of machinery. Repetition work of any kind was rare, and success depended on his resourcefulness and ability to make anything that was required and make it work to his customer's satisfaction. Nowadays the successful engineer was not the one who made the many things for the few, but the one who, centralising all his ability on one or two articles, was able to turn them out in the most perfect way at a very much reduced cost. This same factor was operating similarly among engineering artisans. In former days the most valuable workmen were good all-round millwrights, who could use a plane, file or hammer and chisel, or work a lathe

or other machine as required; as they themselves used to put it, they were equally at home in wood, iron, stone or anything. Fine old fellows they were; one met them occasionally even now in country places, but in engineering centres they were practically extinct. Having dealt with some recent examples of progress in railway, marine and electrical engineering, motor cars, engineers' machine tools and internal combustion engines, the President, in conclusion, said he had spoken of the competition of foreign engineers, which was being felt more and more keenly every year, and he could only add that it was in the hands of such as those present—he was speaking specially to the younger members of their Society—to settle whether English engineers were to take the first place in the engineering world of the future or not. By technical education of every kind, by studying the best methods and appliances in use, and by adapting and improving on them wherever possible; by carefully noting the introduction of any new machines or methods, and by mixing with other engineers and exchanging ideas with them, and, finally, by specialising as far as they could, and so rendering themselves specially valuable in the particular department they selected—these were a few of the methods by which they should hold their own, and perhaps gain back some of the ground they had lost.

On the proposition of Mr Alfred Slater, seconded by Mr R. Read, and supported by Mr. F. G. Wright, a hearty vote of thanks was passed to the President for his very able and interesting address.

Several letters of apology for inability to be present were received from, among others, the past president, Mr. Hamilton Kilgour (whose father was too ill to permit of his leaving Cheltenham for the evening), and the secretary, Mr J. C. Cooke. Mr. W. A. Walton kindly acted for the secretary, and a vote of sympathy was passed with Mr. Kilgour. Mr. R. A. Lister was elected an honorary member of the Society.

At the conclusion of the meeting Mr. Alderman F. G. Wright, now mayor of Swindon (one of Gloucester's boys), was heartily welcomed on his first appearance as a vice-president of the Society, and congratulated on his elevation to the important post of loco superintendent at the Swindon works of the Great Western Railway.

#### TESSERÆ.

##### The Houses of Athens.

ON reading a description of Athens, our ideas relative to the luxuries supposed to have existed there must be entirely changed; for we find that the houses of its inhabitants could be reckoned only cottages, when compared to those of London or Paris. Yet some modern writers pretend that the interior of these simple and confined dwellings displayed the most magnificent furniture and decorations. But to destroy such vain and futile conjectures, it is sufficient to quote an assertion of the orator Lysias, who was perfectly acquainted with the state of Athens and the fortunes of its inhabitants. Very few houses in the capital, says he, are furnished at an expense exceeding a thousand drachmæ or thirty pound sterling. From this estimate we can scarcely suppose common necessities, much less any traces of profusion. Athens abounding in manufactures and peopled almost entirely with artists, was in reality the workshop of luxury, but not of habitation. Neither was Rome, during many centuries, the scene of ostentation. Pliny informs us that in his time the Romans constantly transported the finest statues and most beautiful paintings to decorate their country houses; and lamented that such immortal productions should be exiled from the capital to shine only in retirement. But the ideas of Pliny on this point are nothing more than illusions; for no just reason can be assigned why those citizens, who had collected at a great expense the most precious monuments of the fine arts, should be obliged to place them in some quarter of the capital rather than in a Latin village. Among such retreats their possessors had most probably received existence, and their hearts experienced still a thousand endearing attachments, either to trees planted by their infant hands, or fountains they had embellished in the bosom of some smiling vale. The Athenians in like manner consumed a great part of their fortune in ornamenting those habitations called *eschariæ* which were scattered throughout Attica. But as the functions of senators, archons and areopagites required their residence in the capital, they possessed likewise town houses, as much neglected as those of the country were adorned. Citizens of Athens, exclaimed Pericles, you have banished every generous sentiment and are occupied alone in erecting different works to increase the ostentation of your gardens.

##### Notre Dame, Calais.

The early church seems to have been mainly, if not altogether, built of stone, and in the fifteenth century to have been completely transformed on the exterior. The whole of the later work was executed in brick, of the common light color.

of London stock bricks, very roughly and coarsely executed. Large brick buttresses and pinnacles flank the principal fronts; the window jambs and arches are of moulded brick, but have lost their traceries, which were probably of stone; and a continuous arcade of intersecting brick arches is carried all along the parapets. By far the most important part of the work is the central steeple. This is of magnificent size, so broad, massive and stately as to give unusual dignity to the whole building. It is divided into three bays in width, on each side, by brick buttresses, with brick pinnacles in front of them, and the lines of the three belfry windows on each side are continued down in the form of panelling in the lower stage. The parapet is arcaded in brick, and from behind it rises a spire with four octagonal pinnacles at the angles; the sloping roofs of these, as also the spire itself, are all built of brick. Unfortunately, the spire is truncated, and is finished with an insignificant slated spire rising from within it. It was pierced in the fashion of the spires of this part of France, with traceried openings below and quatrefoiled circles above, which are executed partly in stone and partly in brick. Stone is also used generally here for the projecting string-courses and mouldings, but the weatherings of buttresses and the slopes of the gables are nearly all of brick, set at right angles to the slope in the usual fashion. The old lighthouse at Calais is similarly all built of light-coloured brick, but is so damaged and decayed as to have little architectural value.

### Egyptian Sculpture.

The characteristics of Egyptian sculpture are very peculiar. It exhibits extreme simplicity of design, great breadth of treatment, to the exclusion generally of minute details, and a solid largeness of form. There is little or no variety of expression in the heads, especially of the superior personages represented; a benignant, placid smile appears on all the countenances. Where dress is introduced there is no composition of drapery in the way of movement, nor any indication of folds. The action of the figures, however important or exciting their occupation, is limited by the most severe conventionalism. If sitting or standing, they have the legs parallel, the arms close to the sides, while the heads always look directly in front. Our national collection of antiquities boasts some extremely valuable examples of Egyptian sculpture, and the student may easily consult original specimens, by which he may become acquainted with the style of art of this extraordinary school. Considering the great antiquity of the Egyptians and their long duration as a nation, taking into account, too, the various fortunes of the country both from their own conquests and from the invasion of foreigners, it is remarkable how little change occurred in the leading characteristics of their art. Whether the monuments be of the most remote archaic period or of the more recent ante-Roman time, no sufficient alterations were introduced to destroy that peculiar and distinctive character which stamps all Egyptian art with its national individuality. Certain antiquaries have attempted to define marked epochs in the history of Egyptian sculpture, but though certain changes may be detected in the mode of representation in monuments attributed to different dynasties, they do not afford sufficient authority for anything like a strict chronological classification. From the high finish and more careful execution of the works of the time, it is thought that the national prosperity and therefore the condition of art were highest during the reign of Rameses, about 1350 B.C., and, judging from other remains, that the country and its art were most depressed from the date of the Persian conquest; that is, from 525 to about 344 B.C. Of the latter fact there cannot be any doubt, and although the nation freed itself after a time from the hateful rule of Persia, Egypt never again recovered its ancient renown, nor did she long retain her national independence.

### Roman Palaces.

Rome has more palaces, or noblemen's houses, than any other city in the world. Of these no fewer than seventy-five are of a superior kind, uniting in their external appearance something of the fortress, the prison and the palace. Many of the families to which these buildings once belonged have sunk into poverty and their residences are now turned into ecclesiastical colleges or hotels or let to foreign ambassadors or consuls. In the others which have escaped this fate the lower storey is sometimes let for shops, sometimes retained for tables, coachhouses and servants' rooms. The second storey is generally a picture gallery, consisting of a suite of rooms opening into one another and richly adorned with marble columns and painted ceilings. The owner of the building and these precious works of art often lives in the third or highest storey, and generously throws open the gallery to artists and all who choose to give two or three paoli to the servants. The exterior of these palaces is in general grand and magnificent in architecture; but in the interior, notwithstanding the magnitude of the apartments and the magnificence of the decorations, they are, generally speaking, uncomfortable dwellings, and most of them are deficient in cleanliness and

order. The immense palaces of the Doria, the Colonna and the Borghese are still occupied only by their own families and dependents. The Doria palace contains the largest collection of paintings in Rome, among which are found some of the finest specimens of the ancient masters. The gallery of the Colonna palace, which is by far the grandest hall in the city, once contained a number of celebrated paintings, but the finest have been sold. The palace garden, which hangs on the steep side of the Quirinal Hill, contains the picturesque remains of a magnificent ancient edifice, the name of which is unknown. The palace of the Barberini family formerly contained that celebrated museum of ancient sculpture, vases, gems, medals, &c., which was so long the wonder and admiration of Europe, but it is now sold and dispersed. The famous Portland vase was brought from this museum. There are still some interesting pictures. The palace of the Borghese once contained a fine museum of sculpture, and lately possessed one of the best collections of paintings in Rome. In the Palazzo Massimi is the famous "Discobolus," found in the grounds of the Villa Palombari on the Esquiline Hill. The Palazzo Spada contains the celebrated statue of Pompey, at the foot of which Cæsar fell. In the palace of the Braschi once stood the beautiful colossal statue of Antinous, which was dug up on the site of the ancient Gabii, and has been removed to the Lateran museum. The Palazzo Nuovo di Torlonia, the residence of Torlonia the Roman banker, who purchased the title and estate of the Duca di Bracciano, is fitted up with all the magnificence that wealth can command. The gallery is adorned with Canova's colossal group of "Hercules and Lycas." The Farnese palace contains the far-famed gallery painted in fresco by Annibal Carracci. In the gallery of the Sciarra palace are Raphael's "Player on the Fiddle," Leonardo da Vinci's "Vanity and Modesty," and other masterpieces.

### Red and Black Greek Vases.

At the end of the sixth century B.C., towards the period of the fall of the successors of Peisistratos, the painters of Athens made a marked innovation when they replaced the black figures on their pottery by red figures. The black figures, which remind us a little of *ombres chinoises*, and the cheerfulness of which is very doubtful, were too opposed to the principles of the true and the beautiful to be any longer popular. They allowed of no expression in the faces. To indicate the anatomy it was necessary to have recourse to the stylus and to incise the lines. The details could only be obtained by picking out in white or purple. This drawback disappears when the figures are in a light tone, and stand out from a black background. A mere stroke of the brush then suffices to trace the anatomical details or the folds of the costume. We owe the most admirable productions of Greek painting to the invention of the red figures. It seems, moreover, that the change was very speedily effected, for the vases which combine the two styles—both the black and red figure styles—are very rare. At the head of the painters in red figures stands Euphronios, the greatest of the Attic masters. He stood in the same relation to Greek art as the artists of the fourteenth century stood to the Renaissance. In one respect he belongs to the old school, of which he retains certain traditions—the harshness of drawing, the fear of rounding the angles and of filling up the forms of the body; and that laborious patience which neglects neither a curl of the hair nor a fold of the drapery. But his style is of incomparable breadth, and so far beyond anything ever produced in pottery that his hand may at once be recognised even on vases he has not signed. The personages are alive, the composition is easy and natural, with a slight search for grace; he excels in variety of pose and in the play of expression. Kachrylion, his fellow-worker Hermaios, and Hieron have not the same talent, but like him they know their business. In their hands the clay becomes as plastic as wax, the lines are as fine as a silken thread, and the outlines are drawn with wonderful precision. Only two vases by Hermaios remain. They were intended as companion pieces, a thing very difficult to meet with, even in ordinary vases.

### Lares and Penates.

Penates and Lares were in universal usage among the Romans, and were regarded as the tutelary deities, under whose immediate protection the person, the house, family and possessions of every individual were placed. There were not only "Lares domestici et familiares," but "Lares urbani, rurales, viales, compitales, marini," &c. Some writers have thought the Lares and Penates to be the same, and it would appear that the Lares were included among the Penates. The Lares, however, were of human origin, and appear to have been regarded by the Romans as the manes of their ancestors, while among the Penates we find mention of the superior gods, as Vesta and Jupiter. The divinities were represented by small statues, seldom exceeding a very few inches in height, exquisitely proportioned and wrought and cast in gold, silver and bronze, but the intrinsic value of the first-mentioned materials has occasioned their almost total disappearance. It

was customary with the Romans, when travelling, to carry the Penates with them that they might not omit the usual sacrifice should any festival happen during their journey. When they returned home these images were deposited in the lararium or wardrobe, which stood in some secret apartment, the sleeping room or library. In process of time the Romans were not content with a single lararium but had another containing statues of heroes, poets and eminent men, and even of their patrons. The superstition attached to these small statues was so great that men of the first rank and celebrity did not neglect the usage of them. We have instances in the lives of Antiochus, Xenophon and Cicero. The hearth of the atrium was sacred to the Penates, and as this place was the innermost or most important part of the house it was called the penetralia. There appears sometimes to have been a kind of recess in the wall called sacrarium, in which the images of the Penates were kept. Every master of a family was the priest to the Penates of his own house.

#### Roman Sculpture.

It was not till after the conquest of Greece and the arrival of the enormous collection of works of art brought as plunder and spoil to grace the triumph of the conquerors on their return to Rome that sculpture began to attract any marked attention there. Syracuse yielded up its treasures of art after the conquests of Marcellus, Corinth had been stripped of its wealth in art by Mummius, and Athens also had largely contributed her share of exquisite works in sculpture to enrich the Roman capital. It became a fashion to form collections, and to this caprice modern times are indebted for the preservation of some of the finest productions of Greek art. Verres has been handed down to posterity as one of the most ardent and, it must be added, least scrupulous of collectors, but his anxiety to obtain possession of the most exquisite works of the great masters doubtless occasioned many to be carefully preserved which otherwise would have been neglected or destroyed. In the century preceding the birth of Christ several sculptors of eminence, all having Greek names, were practising in Rome. Both Julius Cæsar and Augustus appear to have made efforts to preserve fine ancient works and so far gave opportunity to the Romans to acquire a taste for art. Augustus, especially, formed collections of statues and other objects of taste, and set an example in this respect that was followed by many of the rich and influential. During the reign of this emperor are found the names of some of the most eminent artists of antiquity—Posidonius, the architect Vitruvius, and Dioscorides. The gems of the latter are among the finest specimens of the art. Nero had statues imported from Greece, and it is astonishing that, notwithstanding the extent to which the country had already been plundered, it is recorded that no fewer than 500 bronze statues were procured from the Temple of Apollo at Delphi.

#### Assyrian Art.

There is no reason why we should not assign to Assyria the same remote antiquity we claim for Egypt. The monuments of Egypt prove that she did not stand alone in civilisation and power. At the earliest period we find her contending with enemies already nearly, if not fully, as powerful as herself, and amongst the spoil of Asia and the articles of tribute brought by subdued nations from the north-east are vases as elegant in shape, stuffs as rich in texture and chariots as well adapted to war as her own. It is not improbable that she herself was indebted to the nations of Western Asia for the introduction of arts in which they excelled, and that many things in common use were brought from the banks of the Tigris. In fact, to reject the notion of the existence of an independent kingdom in Assyria at the very earliest period would be almost to question whether the country were inhabited, which would be directly in opposition to the united testimony of Scripture and tradition. A doubt may be entertained as to the dynasties and the extent of the empire, but not as to its existence; that it was not peopled by mere wandering tribes appears to be proved by the frequent mention of expeditions against Naharaina (Mesopotamia) on the earliest monuments of Egypt and the nature of the spoil brought from the country.

#### The Character of Wren.

Sir Christopher Wren was of low stature, his forehead broad and fair, his nose slightly aquiline, the eyes large and expressive and the whole aspect stamped with intelligence and talent. He was light and active of body, walked with a certain stateliness of air, and his constitution, rather delicate than robust, was saved, it is said, from consumption by habits of regularity and temperance. That he was a little man, a tradition preserved by Seward sufficiently shows. Charles II. on walking through his newly erected hunting palace at Newmarket, said, "These rooms are too low." Wren went up to the king and replied, "An please your Majesty, I think them high enough." Whereupon Charles, stooping down to Sir Christopher's stature, answered with a smile, "On second thoughts I think so too." He had that calm and philosophic temper which contradiction could not disturb; he heard his opinions questioned, and even

saw his designs deformed by the envious or the ignorant without change of mood or a snappish remark. That he shed tears when the Duke of York rejected the best and adopted the worst plan of St. Paul's showed that on great occasions he could not always quite command his feelings; but this will take little from the justice of his son's eulogy when he says "he had such wonderful sweetness of temper, such a steady tranquillity of mind and such pious fortitude that no injurious incident or inquietudes of human life could ever ruffle or discompose Sprat, who is accused of saying fine things of his friends for the sake of saying them, was not suspected of overpraising Wren when he wrote, "His knowledge had a right influence on the temper of his mind, which had all the humility, grace, modesty, goodness, calmness, strength and sincerity of a sound and unaffected philosopher—to his merits his country is further indebted than has been acknowledged." But even if the eulogiums of children and friends should be suspected, the silence of his enemies is praise sufficient; that his long life was eminently useful, virtuous and blameless, no one has questioned. His experiments in science have since been eclipsed by brighter discoveries, but there can be no doubt that he showed an inventive way to much that has since been achieved. His invention was fertile, his ingenuity exquisite and his application unbounded; he could equally attend to the minute and explore the profound, discuss questions of geometrical nicety or speculate like a poet on the possibilities of existence in remote worlds. To him many ascribe the invention of mezzotint engraving, commonly imputed to Prince Rupert; and the annals of the Royal Society are filled with his experimental studies and inventions in philosophy and science. He had some skill in drawing landscape; his view of Windsor was engraved by Hollar, and eight or ten plates from Willis' "Anatomy of the Brain" were from his pencil. He was the inventor of drawing pictures by microscopic glasses; he found out a speedier way of etching, and it should not be omitted that he displayed some skill in verse, though nothing that entitles him to the distinction of a poet. His early prose compositions were in that elaborate and ornate style of which Sidney has given enough in his "Arcadia," but when his judgment ripened and experience and study had stored his mind with knowledge he wrote in a clear and unembarrassed manner and communicated what he had to say like one less solicitous about his language than his thoughts. Sometimes, no doubt, he relapsed for a sentence or two into his original sin of stilted composition, but nature soon regained her sway. We trace in all his writings the practical man, the man of sense, sagacity and observation; he set his face against all romantic views of subjects, ridiculed the proneness of some of his brethren for prognostications, and laid it publicly down as a rule that "experiment and reason is the only way of prophesying events."

#### GENERAL.

**The Dublin Exhibition** of "Old Masters" will be opened by the Lord Lieutenant on December 15. The collections of the Duke of Leinster, Lord De Ros and Sir Algernon Coote have been freely placed at the disposal of the director, Mr. Lane, and many fine and hitherto unknown pictures have thus been secured. There will be at least nine Sir Joshuas, seven Romneys, three Gainsboroughs, four Lawrences and some remarkable works of Lancret and Greuze, besides many good works of Irish artists.

**Mr. A. S. Brickwell**, of the surveyors' department of the Great Northern Railway, has been appointed estate agent and surveyor of the Great Central Railway Company's property in London.

**The Exploration** of Miletus, under the direction of Dr. Wiegand, has been resumed. The discovery of a marble colonnade in which the columns must have been doubled has rewarded the efforts of the party. It evidently surrounded market-place. The foundations of a theatre have also been revealed.

**An Exhibition** of studies by John Constable, with works of various other English masters, is about to be opened in Elberfeld.

**Mr. J. W. Tyler** will read a paper at the meeting of the Surveyors' Institution on Monday next upon "Estate Duties, Valuations and Agricultural Property." The chair will be taken at 4 P.M.

**The Liverpool Cathedral Committee** met on Monday, when letters were read from the architects selected to submit the designs from which the final selection will be made asked for information and for photographs of the site.

**Mr. R. G. Hatton** will, on Wednesday next, deliver a lecture before the Northern Architectural Association on "The Ideas of the Advocates of Handicrafts; their Effect on Architectural Form and Ornamentation." "Coffee Smokers" are to be given by the President on December 10, January 10, February 4 and 18 at 9 P.M.

**Mr. Ellis Marsland** will read a paper on Thursday next before the Society of Architects on "Some Recent Conflagrations and their Lessons to Architects."

THE

**Architect and Contract Reporter.****EDITORIAL NOTICES.**

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

**TENDERS, ETC.**

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

**COMPETITIONS OPEN.**

**ASHTON-IN-MAKERFIELD.**—Dec. 31.—Designs, &c., are invited for the enlargement of the Infectious Diseases Hospital. The architect whose plans are accepted and approved will be retained by the Council to carry out the work at the usual professional charges. Plan of the hospital site, together with full particulars of the alterations and extensions required, may be obtained from Mr. T. Burgess, surveyor, at the Council Offices.

**BRIDGWATER.**—Feb. 28.—Plans, specifications and estimates are invited in competition for power and appliances to deal with the accumulations of silt in portions of the river Parrett. Mr. W. T. Baker, town clerk, King Square, Bridgwater.

**CAPE TOWN.**—Jan. 31.—The Council of the University of the Cape of Good Hope invite designs for the erection of university buildings. Premiums of 400*l.*, 200*l.* and 100*l.* will be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

**DURBAN (NATAL).**—Dec. 18.—Design are invited for new town hall, library, museum, art gallery and municipal offices. Three premiums of 500*l.*, 300*l.* and 200*l.* respectively will be awarded for the three best designs in order of merit. Mr. W. H. Radford, C.E., Albion Chambers, Nottingham.

**ECCLES.**—Dec. 12.—Plans are invited for the laying-out of an area of land and for erection of dwellings for the working-class on part of such area. Premiums of 50*l.*, 30*l.* and 15*l.* will be awarded in respect of the plans placed first, second and third in order of merit. Mr. Wm. Henry Hickson, town clerk, Town Hall, Eccles.

**HULL.**—Jan. 31.—Designs in competition are invited for the extension of the town hall. Premiums of 300*l.*, 200*l.* and 100*l.* are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

**KINGSTON-ON-THAMES.**—Jan. 15.—Plans and designs are invited for a central home and cottage homes for children of both sexes in the Kingston Road, in the parish of New Malden. A premium for the first three selected plans of 25*l.*, 15*l.* and 10*l.* respectively is offered. Mr. Jas. Edgell, clerk, Union Offices, Coombe Lane, Kingston-on-Thames.

**SURBITON.**—Dec. 16.—Designs are invited for erection of a Coronation memorial clock tower near the refuge in the area fronting Surbiton station. Premium 10*l.* 10*s.* Dr. Coleman, chairman, clock committee District Council Offices, Surbiton.

**CONTRACTS OPEN.**

**ACCRINGTON.**—Dec. 13.—For erection of a parish-room at St. John's Church, Accrington. Mr. Henry Ross, 15 Cannon Street, Accrington.

**AUSTRALIA.**—Dec. 22.—For erection at Perth, Australia, of a rubbish destructor capable of dealing with forty tons of garbage in eight hours. Mr. W. E. Bold, town clerk, Town Hall, Perth.

**ASHFORD.**—Dec. 12.—For external painting and repairs to various properties, for the Ashford Urban District Council. Mr. John Creery, clerk to Urban District Council, 11 Bank Street, Ashford, Kent.

**ASHTON-UNDER-LYNE.**—For erection of a pair of houses in Taunton Road, Ashton. Messrs. Thos. George & Son, architects, Old Square, Ashton-under-Lyne.

**BARNESLEY.**—Dec. 8.—For pulling-down the present old buildings and erection of new clerk's offices, relief offices and relieving officer's house in Pitt Street, Barnesley. Messrs. Crawshaw & Wilkinson, architects, 13 Regent Street, Barnesley.

**BEVERLEY.**—For erection of Wesleyan Sunday schools, &c., at Beverley. Messrs. W. J. Morley & Son, architects, 269 Swan Arcade, Bradford.

**BEXHILL.**—Dec. 15.—For extension of engine-room, boiler-house and offices at the electric light works, for the Town Council. Mr. George Ball, borough surveyor, Town Hall, Bexhill.

**BEXLEY HEATH.**—Dec. 8.—For erection of car-shed buildings. Mr. T. G. Baynes, clerk, Urban District Council, Public Hall, Bexley Heath, Kent.

**BRADFORD.**—Dec. 8.—For alterations to the old car dépôt, Thornbury. Mr. Frederick Stevens, town clerk, Town Hall, Bradford.

**BRADFORD.**—Dec. 11.—For erection of three houses in Huddersfield Road, Wyke. Messrs. Fairbank & Wall, architects, Craven Bank Chambers, Bradford.

**BRADFORD.**—Dec. 13.—For erection of new central baths and public hall, Morley Street, Bradford. Mr. Frederick Stevens, town clerk, Town Hall, Bradford.

**BRIDLINGTON.**—Dec. 9.—For alterations to 3 Prince Street. Mr. J. Earnshaw, architect, Wellington Road, Bridlington.

WALES.—For erection of a vicarage at Ystradfellte. Mr. Glendinning Moxham, architect, 39 Castle Street, Swansea.

### TRADE NOTES.

THE Rochford Union infirmary is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues and patent Manchester grates.

MESSRS. HANDYSIDE & CO., LTD., of Derby, makers of steel bridges, roofs, buildings and structures, have secured the contract for the new drawbridge over the North Dock lock at Swansea for the Swansea Harbour Board.

THE Economic Fencing Company, of Billiter House, E.C., will show at the Cattle Show, Stand No. 34, in King Edward's Hall, Agricultural Hall, their latest patterns of patent machine-made fencing. This company are inaugurating new works on the river side to meet the increased demand for quick supply.

THE St. Pancras Iron Work Company, Limited, have recently completed the fitting up with their patent stable fittings of an extensive range of stabling at Woburn Abbey, Beds. This is the second order of this nature with which they have been favoured by the Duke of Bedford.

MESSRS. HAYWARD-TYLER & CO., of 90 and 92 Whitecross Street, E.C., have prepared an artistically got-up catalogue of the electrically driven and other treble-barrel pumps which they manufacture in numerous dimensions and capacities suitable for all imaginable purposes to which pumps can be applied, the delivery power ranging from 125 to 590,500 gallons per hour.

It is always a source of satisfaction to playgoers and others to know that the arrangements for their safety are studied by the management. In this connection the London County Council has no doubt effected many reforms, including the provision of fireproof curtains between the stage and auditorium. Quite a number of theatres and amusement halls are just now being fitted with such curtains by Merryweathers, who make a specialty of such work, in addition to the fire protective apparatus with which they are usually associated. The following, we learn, are amongst some of the theatres now installing the curtain:—Sir Charles Wyndham's new theatre, Haymarket,

Old Gaiety, New Gaiety, Garrick, Pavilion (Mile End), Royal (Holborn), South London and others.

MESSRS. MATHER & PLATT, LTD., engineers, of Salford Iron Works, Manchester, inform us that they have recently received instructions to carry out the sewage purification works at the following hospitals amongst other institutions of a similar kind:—Sanatorium for Consumptives, Delamere, Cheshire; Epileptic Colony, near Alderley Edge, Cheshire; County Asylum, Winwick, Lancashire; Smallpox Hospital, Warrington. They have also received instructions to supply eight of their patent revolving spreaders for the Dorchester purification works. Amongst the spreaders which they are now constructing is one of 120 feet diameter for the Birmingham Tame and Rea Drainage Board, and one of 200 feet diameter for Chichester. In connection with these revolving spreaders their patent automatic and distributing discharge valves will be used.

MESSRS. ALLEN, JONES & CO., of Hatherley Works, Gloucester, have on view at their London showrooms, 34 Worship Street, E.C., a large variety of their specialties, which comprise Jones's patent Hatherley lattesteps which, as will no doubt be gathered from the name, are folding steps or ladders made on the lattice or slat principle, by means of which the maximum of strength and rigidity is combined with the minimum of weight. Messrs. Allen, Jones & Co. apply the principle embodied in the manufacture of these steps to folding chairs, tables, &c., of which they show some pleasing patterns, a useful combination of shop seat and steps being worthy of note in this department. Another notable piece of furniture is a collapsible tennis-table, which by means of their ingenious compensating joint is prevented from shrinking or warping. Owing to the joints being glued as well as reinforced on the underside, these half-inch tops are as solid as an inch top, with the advantage of being, of course, half the weight. The underframe has a continuous top rail, which undoubtedly will be found superior to trestles or anything else in the market for tennis tables or other occasional requirements. Among other specialties which we noted were bed-tables, bicycle stands in variety and other articles of a like useful nature.

MR. W. MACKAY, known as the Lumber King of Canada, died at Ottawa on December 1. Mr. MacKay went to Canada when a boy, from Ireland, without a shilling in his pocket, and his first position was that of a mill hand in the North-West. The fortune he has left exceeds three million dollars.

## VARIETIES.

MR. ERNEST MAWDESLEY, town clerk of Croydon, died yesterday.

Two new Board schools have been opened at Wolverhampton—one in Springfields, for children in Standards 3 to 6, and one in Bingley Street, Lea Road, for children in Standards 1 to 4. Each school will accommodate over 200 children.

At a meeting of the Llangollen Town Council the dangerous state of the town hall was again discussed, and the chairman announced that negotiations were progressing with the Local Government Board, who were retaining the Council's plans to secure the building. Ultimately the Council resolved to appeal to the authorities to hurry on the Government official inquiry.

A NEW Board school was opened at Kinfauns, N.B., on the 1st inst. It has been built for 100 pupils, the accommodation of the old school having proved insufficient. It is situated to the east of the former school, and the front extends about fifty feet. There are two classrooms—one an infant department—besides cloakrooms for boys and girls. In the playground are shelter sheds. Mr. H. J. Bell, C.E., Perth, is the architect.

THE Commissioners of Northern Lighthouses on Monday took over the historic Bass Rock, and in the evening their magnificent new lighthouse there was lighted up for the first time. The lantern is a six-flash light of 39,000-candle illuminating power. The adjoining keepers' houses have been provisioned for six months. During the building of the lighthouse opportunity was taken to restore the crumbling masonry on the east bastion, against which the waves dash ceaselessly, and in stormy weather to a great height.

THE new public baths, erected at Elland by the District Council at a cost of about 6,000*l.*, were opened on the 22nd ult. by Councillor Eastwood, chairman of the Council, who said that the new baths were the largest project the District Council had yet undertaken, with the exception of the sewage works. The latter cost them between 14,000*l.* and 15,000*l.*, and they had proved a great factor in lowering the death-rate and improving the sanitary condition of the district. The Council were now engaged in another large work, namely, the installation of electric light in conjunction with a refuse destructor.

THE building which has been completed for Lodge Torphichen, Kilwinning No. 13, at Bathgate, N.B., has just been consecrated. The hall was formally opened by Robert Kirk, M.D., R.W.M. of Lodge Torphichen, Kilwinning. The consecration ceremony was performed by Thomas Hope of Bridgecastle, R.W.P.G.M., and the Provincial Grand Lodge of Linlithgowshire. A dinner took place in the evening in the Corn Exchange, Dr. Kirk presiding. The building is situated in Jarvey Street, and is two storeys in height, the shop fronts and hall fittings being of oak. The architect is Peter L. Henderson, J.P.M. of Lodge Cannongate No. 1.

MR. E. W. MOUNTFORD, the assessor appointed to adjudicate upon the designs sent in for the new central library in Deanery Road, Bristol, has made his award. Altogether sixty-one designs were received. Mr. Mountford has awarded the first prize to Mr. H. Percy Adams, of Russell Square, and this is the design from which the new library will be erected. The next in order of merit, carrying a premium of 100*l.*, is the design of Messrs. Nott & Collins, of Chelsea, and the third, for which a premium of 50*l.* is given, is that of Mr. A. T. Butler, of Cradley Heath.

THE foundation-stone was laid on Monday of new voluntary schools in course of erection at Rubery, Worcestershire. In 1808 the managers of St. Chad's Church received permission to open an infants' school in the vestry of the church on condition that a permanent school building was built within five years. Twelve months ago an intimation was received from the Education Department that that body would call upon the Bromsgrove School Board to erect a school unless plans for a new building were forwarded. As a consequence of this some 1,150*l.* has been subscribed towards the erection of a new school, and Christ Church College, Oxford, gave a site containing about half an acre, situated in the New Road. Here a

new school has been begun, the cost of which is estimated to be about 1,550*l*. The new structure will provide accommodation for about 200 children.

THE Eton Rural District Council have been asked to approve of the action of their surveyor in connection with a dispute between the Council and a water company. The Bucks County Council had opposed the Rickmansworth Water Company obtaining certain parliamentary powers unless assurances were given that the company would not take more water out of Bucks than was brought in. Nevertheless, without obtaining those powers, the company laid 70 yards of piping in the Eton Council's district, whereupon the surveyor borrowed a traction engine from an obliging local landowner, hitched chains on to the pipes from the engine, and pulled them out of the ground. The Eton Council approved of this action, and commended the surveyor for his promptitude and energy.

WITH a view to the erection of a common hospital, the draft of the proposed provisional order for forming a united district under the provisions of the Public Health Act, 1875, has been prepared by Mr. Horatio Brevitt, the town clerk of Wolverhampton. The districts which the proposed order will affect are Amblecote, Bilston, Caseley, Darlaston, Heath Town, Rowley Regis, Short Heath, Tettenhall, Tipton, Wednesfield, Kingswinford, Smethwick and Wolverhampton. The scheme differs from that formulated by the county medical officer of health, inasmuch as it leaves out of its scope Brierley Hill, Handsworth, Perry Barr, Quarry Bank, Wednesbury, Seisdon, Walsall, West Bromwich and Dudley. The cost of erecting a suitable hospital has been estimated at 9,000*l*, and authorities within the area representing a population of 337,394 are in favour of the scheme. The governing body would consist of three *ex officio* and twenty-four elective representatives. The expense of erecting the hospital will be paid *pro rata* by the sanitary authorities named.

THE annual meeting of the Society of Antiquaries of Scotland was held on Monday, the Right Hon. Sir Herbert Maxwell, president, in the chair. The following is the list of the office-bearers and council for the ensuing year:—President, the Right Hon. Sir Herbert Maxwell; vice-presidents, David Murray, the Earl of Southesk and Robert Munro; secretaries, D. Christison and the Hon. John Abercromby; foreign secretaries, T. G. Law and William K. Dickson; treasurer, John Notman; curators of the museum, Professor Duns and Alexander J. S. Brook; curator of coins, George Macdonald;

librarian, James Curle, jun. Councillors—Sir George Reid and Sir Arthur Mitchell, representing the Board of Manufactures; Sir Kenneth Mackenzie, representing the Treasury; Colonel M'Hardy, James Macdonald, the Hon. Hew H. Dalrymple, Robert Bruce Armstrong, Thomas Ross, Dr. T. H. Bryce, William Garson, John M. Howden, and Professor P. Hume Brown. Dr. Christison, secretary, gave a report of the work of the Society during the past session, referring specially to the excavation of the fort on the Roman wall at Castlecary, a detailed account of which will be submitted to the Society in the course of the ensuing session. The number of antiquities added to the museum during the year had been 374 by donation and 546 by purchase, and 103 books had been added to the library by donation and 68 by purchase.

AT a joint meeting of the architectural section and the sanitary and social economy section of the Royal Philosophical Society of Glasgow, held on Monday evening at 207 Bath Street (Mr. Chalmers, president of the architectural section, presiding), Mr. A. B. MacDonald, the city engineer, delivered a lecture on "The sewage disposal of Glasgow and adjacent burghs." He described the main drainage scheme of the city at present in course of construction, stating at the outset that, with the sole exception of a London scheme, it was the greatest of the kind that had ever been embarked upon. It was divided into three sections—one at Dalmarnock, on the northern bank of the river, another at Dalmuir, and a third at Braehead, on the southern bank of the river. The Dalmarnock section comprised about 11 square miles, and the Dalmuir and Braehead sections each 14 square miles. The daily volume of dry-weather sewage treated at Dalmarnock was about sixteen million gallons, which would ultimately be increased to twenty million gallons. That treated at Dalmuir would be forty-nine million gallons, and that at Braehead forty-eight million gallons. For the collection and disposal of these ninety-seven millions of gallons of sewage there would be constructed thirty miles of sewers varying from 2 feet 6 inches to 10 feet in diameter, the separate capacities of which had been calculated to discharge 214 millions of gallons of water. During the course of next year it was hoped that the work on the northern bank of the river would be so far advanced as to permit of a greater quantity of sewage from the western area being purified, and a corresponding improvement on the condition of the river effected. The works on the southern bank would require a longer time for their completion. A discussion followed the lecture, and at the close Mr. MacDonald was awarded a vote of thanks.

**ELECTRIC NOTES.**

AT Tuesday's meeting of the Llangollen Town Council the chairman reported the formation of an electric lighting and power company to carry into effect the project of installing electric light into Llangollen.

A MEETING of the Redditch Urban District Council was held on the 2nd inst. Mr. Gross called attention to the unsatisfactory nature of the electric light in the town. It had been so bad of late that a number of large consumers were threatening to have the supply cut off. The whole thing, he said, was so very unsatisfactory that it was his intention to give notice at the next meeting to propose that the Council offer the whole electric lighting system, "lock, stock and barrel," to Mr. Pierpont Morgan for 30,000*l*.

MR. R. H. BICKNELL, C.E., inspector of the Local Government Board, held an inquiry at the Town Hall, Rhyl, on Wednesday, respecting an application by the Rhyl Urban District Council for sanction to borrow 9,567*l*. for purposes of electric lighting, and 2,233*l*. for refuse destructor purposes. Mr. Arthur Rowlands (town clerk) conducted the application on behalf of the Council. Mr. Rowlands said the scheme had by force of circumstances grown much larger than they first anticipated. The loans originally taken up in connection with the undertaking amounted to 14,640*l*., and what they had now applied for was an excess loan upon that amount which had been overspent. The Inspector said it was an absolutely improper thing for the Council when they found they had not enough money to go on with the scheme. They should have lost no time in making further application to the Local Government Board before spending anything beyond the original estimate. Details were then gone into at some length, the Inspector remarking at the outset that he wished to make it perfectly clear that these excess loans were very irregular and very unnecessary. He intended making the matter very clear to the Local Government Board, and if any further expenditure of this kind occurred in Rhyl it would be very doubtful if they would get any further assistance from the Board. The inquiry then proceeded, but there being an insufficiency of figures before the Inspector, the result was that they failed to work out at the amounts indicated. The Council retired to consider what course should be taken, and eventually it was decided to adjourn the inquiry, the Inspector tentatively fixing upon January 6, 1903, as the date for the resumed hearing of the application.

AT a meeting of the Inverness Town Council communications were submitted from the Board of Trade and the Caledonian Canal Commissioners regarding a water-power scheme for the electric lighting of the burgh. A provisional order was obtained over two years ago for a steam-power scheme, which, though the preliminary expenses amounted to about 4,800*l*., fell through, and the old idea thereupon revived of drawing power from the canal, where a fall of 30 feet is available. It seems that the Canal Commissioners, owing to the sitting of Parliament and other State affairs, cannot meet till February to consider the application of the Town Council for water rights, while the Board of Trade has only postponed its judgment as to whether the provisional order can be renewed to the end of December. In the meantime several applications have been made by private companies for the necessary Parliamentary sanction to supply the light both for public and private purposes. In the circumstances the Council resolved to again communicate with the Board of Trade through their Parliamentary agents, and also to accept the offer made on behalf of the Caledonian Canal Commissioners to the effect that, provided water rights are granted, the supply might cease when the flow reaches a minimum of 18 feet 3 inches at Dochgarroch Lock.

**BUILDING AND BUILDERS.**

AT a meeting of the Crewe Town Council on Wednesday, the mayor (Mr. J. H. Moore) presiding, it was decided to accept the tender of Messrs. John Garner & Son to erect a diphtheria ward attached to the isolation hospital for 2,296*l*.

THE foundation-stone of a new Independent Methodist church at High Park, Southport, was laid on the 29th ult. The new building, which is situated in Old Park Lane, and will be built in a simple Norman style of architecture at a cost of about 1,400*l*., will take the place of a smaller structure facing High Park Road, which was built twenty-two years ago.

MESSRS. KERR & WATSON, architects, Johnstone, N.B., have prepared plans, which have been accepted, for the erection of the new Conservative Club buildings, ground for which has been secured in Rankin Street, Johnstone. Provision is made for a good hall on the ground floor to accommodate about 300 people. In the upper flat there will be a spacious billiard-room with four tables, a recreation-room, a reading-room and other rooms for the carrying on the work of the association, besides a janitor's house and other auxiliaries.

THE SILICATE PAINT CO., J. B. ORR & CO., Ltd., CHARLTON, LONDON, S.E.

Work will be commenced so soon as the contracts are fixed. The building will cost upwards of 2,000*l*.

THE opening lecture of the series in connection with the Building Trades' Exchange of the City and District of Edinburgh, Limited, was delivered on the evening of the 27th ult. in the Exchange Rooms, 26 George Street, Edinburgh, by Professor Stanfield, M.I.C.E., F.R.S.E., Heriot-Watt College. There was a good attendance. Mr. W. Graham-Yooll (president) occupied the chair. Professor Stanfield, the subject of whose address was "Some Notes in Connection with Materials used in Building Construction," dealt first with the manufacture of materials used in building and engineering construction, then with their physical properties, and giving the results of special tests of the strength of girders and beams. He also pointed out cases of the ignorant treatment of metal after leaving the manufacturer's hands. At the close of his lecture Professor Stanfield was heartily thanked.

A SPECIAL meeting of the Stourbridge Urban Council was held on Monday evening, with reference to an important street improvement and to the scheme for a combined free library and technical institute. Mr. Isaac Nash presided. It was stated in regard to the latter question that the consulting committee thought it desirable they should arrange a conference with an equal number of the technical board to discuss their mode of procedure. The Highway and Consulting Joint Committees reported on the question of the suggested purchase of properties belonging to the North Worcestershire Breweries, Limited, which front Coventry Street and Duke Street, for the purposes of street widening and improvement, and recommended that the purchase from the brewery company should be effected on the terms provisionally agreed. There was a long discussion in committee, and on resuming the report was adopted; and a resolution was passed asking the joint-committee to ascertain the entire cost of widening Duke Street and Mill Street, and uniting them by a new street, and to report at the earliest possible moment.

THE Worcester City Council was engaged on Tuesday upon the question of the disposal of the sewage, the water and sewage committee recommending that tenders be obtained for the construction of the first section of the works, including the tunnel, &c., under the river, required for conveying the sewage to Bromwich. The Local Government Board sanctioned loans of 48,000*l*. and 4,000*l*. for carrying out the scheme in January 1901. An amendment was proposed, and supported by recently-elected members of the Council, postponing the matter

for a month owing to their lack of knowledge of the scheme. The town clerk (Mr. S. Southall) reminded the Council that the mandamus obtained against them was still in force requiring them to carry out the scheme. Mr. Charge said that when the city boundary was extended in 1885 they gave an undertaking to carry out a scheme of sewage-disposal to stop the pollution of the Severn within three years. After seventeen years they were in precisely the same position as they were in then. Upon a division the amendment was defeated, and the resolution carried with only two dissentients.

At the Railway Hotel, Ainsdale, Colonel A. J. Hepper, D.S.O., R.E., conducted an inquiry into an application of the West Lancashire Rural District Council for sanction to borrow 6,500*l*. for purposes of sewerage and sewage disposal for the township of Ainsdale, including the execution of works in the township of Halsall. Mr. Dickinson, clerk of the West Lancashire R.D.C., stated that for many years Ainsdale had suffered from want of a proper sewage system, and the present cesspool system was very unsatisfactory. They had persuaded the Marquis de Casteja to let them have on lease four statute acres of land just over the boundary of Ainsdale and abutting on Fine Jane Brook. At Crossens the water was pumped into the estuary of the Ribble. The Scarisbrick trustees would keep the water pumped, and they had obtained an easement for 30 years at 20*l*. per year. The rent for the four acres of land was only 10*l*. per year. The sewage would first go into a tank and pass on to filter beds supplied with Stoddart's patent continuous sewage filter. The cost would work out at about a shilling rate spread over 30 years. Further evidence having been given, Mr. J. E. Jarratt (town clerk of Southport) said Southport was very considerably affected by the scheme, and he wanted a guarantee that the effluent going into Fine Jane Brook would not be injurious and would come up to the standard required by the Ribble joint committee. The Inspector made a note of Mr. Jarratt's observations and closed the inquiry.

THE Town Council of Aberdeen are, we learn, on the eve of commencing a noteworthy piece of engineering, whereby the main drainage of the whole of the city is to be carried underneath the bed of the river Dee on its way to the sea. Hitherto the sewage has been discharged into the harbour, but under the new scheme, which is to cost 170,000*l*., it will be thrown into the ocean near Girdleness, a little to the south of Aberdeen. The sewage will be conveyed underneath the bed of the river by an inverted syphon, operated by gravitation; but the

carrying out of the work has been complicated by the proposals of the Harbour Commissioners to convert the river bed above the site of this syphon into a dock. At present the Commissioners are engaged putting down sections of quay wall on each side of the river through which the syphon will be carried, this forming one of the most difficult operations in this class of engineering. The syphon tunnel, which is of cast-iron, built in sections, will be constructed in the same way as the most recent of the London underground railways, viz. by means of a shield and compressed air. The top of the tunnel will be situated at a depth of 41 feet below high-water mark, to enable the river to be dredged above it for the passage of shipping. The burgh surveyor's department, under Mr. Dyack, C.E., has charge of the laying of the syphon, and the operations to be undertaken by the Harbour Commissioners in connection with this important scheme are being executed under the superintendence of Mr. R. Gordon Nicol, C.E., their engineer.

### COMPUTATION OF THE STABILITY OF HIGH CHIMNEYS.

THE Prussian Minister of Public Works has acted on a recommendation of the Prussian Building Academy and has issued a set of regulations governing the design of high chimneys. As reported by the *Deutsche Bauzeitung*, these regulations are essentially as follows:—

The regulations generally prescribe an assumed wind pressure of about 26 lbs. per square foot on a plane perpendicular to the direction of the wind. Any possible suction on the leeward side is assumed to be included in this pressure. The wind area of the chimney is taken to be its vertical section, and if the chimney is polygonal its greatest diametral section is to be used. The point of application of the resultant of the wind pressure is to be assumed to coincide with the centre of gravity of the section, which is equivalent to assuming a uniform distribution of the wind pressure over the full height of the chimney. For circular chimneys the total wind pressure area is to be reduced to two-thirds, and for octagonal chimneys to 71 of the value for rectangular chimneys.

To determine the greatest pressure at the edges the wind should be assumed to act in a diagonal direction. The specifications allow the theoretical opening of the joints to the centre of gravity of the section, thus neglecting the tensile stresses. The compressive stresses should be determined

for wind pressures of 26 and 31 lbs. per square foot. The weight of the material per unit of volume should be that of the actual material used. The allowable unit stresses were fixed as follows:—For common brickwork laid in lime mortar (1:3), 100 lbs. per square inch; for hard burnt bricks, having a compressive strength of at least 3,160 lbs. per square inch, laid in cement-lime mortar (1 cement, 2 lime, 6 to 8 sand), 171 to 214 lbs. per square inch. For the stronger stones and mortar richer in cement, higher stresses are allowable, but a factor of safety of 10 must always be provided for, and in no case should the greatest pressure exceed 316 lbs. per square inch for a wind pressure of 26 lbs. per square foot. If higher unit stresses be deemed allowable, they should be justified by tests on blocks of masonry. The allowable compressive stress on the foundation is, for unrammed concrete, 85 to 114, and for rammed concrete 142 to 214 lbs. per square foot. The allowable bearing pressure on the soil for the assumption of 26 to 31 lbs. per square foot wind pressure is, as a rule, 61 lbs. and, exceptionally, 82 lbs. per square inch, equal respectively to very nearly 4½ and 6 tons per square foot.

### ROAD-MAKING IN SOUTH AFRICA.

BY AN EX-PUBLIC WORKS DEPARTMENT MAN.

THE Cape Public Works Department is perhaps more comprehensive in the branches with which it deals than most other colonial works offices. From building gaols to making bridges or repairing roads, all is dealt with in the small office in Grave Street, Cape Town. The matter of keeping the roads (up-country) in decent order is a serious one. When the "rains" come on the torrents that pour down the highways from the hills sweep the bed of the road before them. Then the next waggoner who comes along and gets "stuck" sends a report to the P.W.D. Office. The Department has its "road parties" scattered all over the length and breadth of Kaffirland. These road parties consist of one white man and a gang of from forty to sixty Kaffirs. The white man is paid at the rate of 10*l.* a month; the natives receive from 10*s.* to 12*s.* 6*d.* a month and their rations of mealies. The life is a very monotonous one, and no new-comer to the country could endure it; but the men who hold these positions are invariably men with years of colonial experience, and the dulness of their surroundings does

not affect them. It is reckoned that, taking the seasons round, one road party will be fully occupied in keeping fifteen miles of road in order. New roads are constantly being made in the Transkei. Transport riders start them (for transport riding is still carried on here—the railway is a thing of the future) by taking short cuts. This soon leaves the wheel-marks. Then somebody writes a letter to the nearest newspaper, "Why is not a road made in such and such a direction?" and before long a few parties will be despatched and the road started. The winters in this part of the colony are very severe, more so in fact than might be believed. This adds to the road party man's discomfort, and also to the danger he is called on to face continually in the use of dynamite. The manner in which a group of "boys" will seize a case of this explosive and dump it into a Scotch cart preparatory to moving camp would give a nervous person nightmare for a considerable period, but the old saying that "Where there is no fear there is no danger" seems to hold particularly good in the case of the natives, and few accidents ever occur. The road party man, after a time, looks on every man who travels on wheels as his natural enemy. This feeling is more intensified in the case of the post-cart driver than anyone else, because a complaint from the postal department is considered more serious than one from an ordinary civilian, and the post-cart driver who receives, may be, £14 a month, and is a power in his own district, takes full advantage of this state of affairs—at least so all road party men declare, and, speaking personally, I think they are right.

### AUCTIONEERS' INSTITUTE.

A GENERAL meeting of the members of the Hants, Wilts and Dorset Branch of the Auctioneers' Institute was held at Eastleigh on the 25th ult. There was a fairly large attendance. Amongst those present were Mr. A. A. Burnett (Southampton), chairman of the Branch, Mr. W. Burrough Hill (Southampton), Mr. W. Harris (Winchester), Mr. E. A. Scammell (Eastleigh), Mr. W. E. Moorey (Christchurch), Mr. A. Wyatt (Fareham), and Mr. A. Godwin Pratt (Boscombe), hon. secretary. The parent Institute was represented by Mr. W. Bennett Rogers (past president), and Mr. Charles Harris, the general secretary (London). After luncheon at the Junction Hotel the hon. secretary read the report of the committee, which showed that the branch now numbered over forty members, and was in a

thriving condition, both as regards numbers and finances. The applications which had been sent down from the Council had been carefully considered, and most of the candidates had been recommended for election. On the motion of the Chairman the report was adopted, and a vote of thanks was given to the committee. Mr. A. A. Burnett read an interesting paper upon "Professional Practice," during which he said he trusted the day of the "furniture dealer and auctioneer and valuer" was rapidly coming to an end, and that they looked to the members to bring in professional men only to the Institute. He thought the custom of placing a number of agents' boards upon a property which was for sale or to let caused that property to assume a derelict appearance, which could not be to the advantage either of the owner or the agents. He suggested that where it was desired to place properties in the hands of all the agents in any particular place, one board only should be placed upon the property stating that "particulars may be obtained of all the principal agents." He also trusted that the day would soon be past for looking at the obituary column as a source of income in the way of touting for valuations for probate. With regard to valuation fees, he thought any attempt on the part of the Institute to fix a scale for the whole of the country would be dangerous and impracticable. On the other hand, he thought that each town or district might have some uniformity of scale. He deprecated, in the case of valuations for mortgage, the pernicious practice of accepting one fee if the mortgage was carried through, and another if it was not, the work and skill required being equal in both cases. No premium should be offered for a high valuation. Again, if they were called upon to value property of which they did not consider they had sufficient knowledge they should, in the interests of their clients and of their professional reputation, seek the assistance of experts. Neither should they be persuaded to divide commissions with members of other professions; the principle of introducing business should be "give and take." He thought practices of that kind could be put a stop to if the members of the Institute would work together with that object. He had formed these opinions after a membership of the Auctioneers' Institute for fourteen years. The points raised in the paper were discussed by several of the members, and a vote of thanks to Mr. Burnett was carried with acclamation. The committee then proceeded to transact the general business of the branch, during which several applicants for membership were recommended for election.

Published every Friday by GILBERT WOOD & Co., Ltd., at the Offices, 6-11 Imperial Buildings, Ludgate Circus, London, E.C.

**STANDARD PORTLAND CEMENT TESTS.\***

ALL experiments shall be carried on as nearly as possible at a uniform temperature of 65 degs. Fahr., except when tests are being made for the purpose of ascertaining the comparative strength of cements required for winter use.

**1. Proportions.**

All proportions shall be determined by weight.

**2. Fineness of Cement.**

For the present a maximum residue of 10 per cent. on the 100 by 100 mesh sieve shall be the test for fineness, and the whole of the cement shall pass a 50 by 50 mesh sieve. The gauge (Stubb's) of the wire shall be No. 35 for the 50 by 50 sieve, and No. 40 for the 100 by 100 sieve. A mechanical sifter, working automatically by jig motion, and thus eliminating personal error, is recommended.

In the case both of hand mixing and sifting with the mechanical mixer the process shall occupy a definite time, depending upon the weight to be sifted and the diameter of the sieve. For example, with a weight of 10 oz. of cement, and sieves 8 inches in diameter, the sifting shall be continued 2½ minutes on No. 120 sieve, 1 minute on No. 100, ¾ minute on No. 60, and ½ minute on No. 50.

The introduction of small weights, such as washers, into the cement while being sifted is to be deprecated, as they tend to push an undue proportion of the cement through the mesh, to stretch the wires and to increase to some extent the grinding. Such practice should not be allowed excepting on works of construction, where there may be a necessity for ordinary rough tests.

The sieves shall be periodically examined with great care, as moisture sometimes collects on the wire, so that when a residue test is made this moisture mixes with the cement, causing a coating on the wires, and often appreciably diminishing the area of the mesh.

The sand for standard tests shall be quartz, crushed so that the whole can pass through a 20 by 20 mesh sieve (wire No. 28 Stubb's gauge), but sufficiently coarse to allow of the whole being retained by a 30 by 30 mesh sieve (wire No. 21 Stubb's gauge).

\* Report of special committee submitted to the Canadian Society of Civil Engineers.

**3. Specific Gravity.**

The specific gravity is for the purpose of determining the degree of calcination of a cement with certainty, and is therefore of great importance. The specific gravity of a Portland cement shall be at least 3.09, and shall not exceed 3.25 for fresh cements, the term "fresh" being understood to apply to such cements as are not more than two months old. The gravimetric system is recommended for the determination of the specific gravity.

Portland cement improves with age, provided it is properly stored and kept in air-tight bags or barrels. Specifications, therefore, should not prescribe only fresh cement.

The following description of the method of carrying out this test is taken from a paper on "Testing of Portland Cement," by Gary, Trans Amer. Soc. of Civil Engineers, October, 1893:—

"The determination of the specific gravity of the cement particles by the volume-meter of Schumann is a well-known uniform method. This consists of a glass bottle of about 200 cubic centimetres (12.2 cubic inches) capacity, with a calibrated glass tube in its neck. The bottle is nearly filled with oil of turpentine, the tube tightly inserted and filled by a pipette with the same oil to the zero mark of the scale, care being taken that all air bubbles are removed. One hundred grains (3.5 ozs.) of cement is put in through the tube, which is then closed by a cork. When the fluid becomes clear, the height of its top surface is noted on the scale. The weight of the cement divided by its volume, as determined by the scale of readings, gives the specific gravity. To secure precise results, it is necessary that the temperature should remain uniform throughout the experiment, and hence vessels, cement and oil must have been kept in the same room for some considerable time. In hot weather the apparatus can be put into water of a known constant temperature. If 100 grains of cement are used a rise of 1 deg. Cent. between the two readings decreases the specific gravity 0.8 per cent."

**4. Blowing Test (for Free Lime, &c.).**

The hot-bath test for detecting the presence of free lime &c, shall be carried out in the following manner:—Mortar pats, prepared of neat cement and thoroughly worked, shall be trowelled upon ground glass plates (carefully cleaned, preferably with acid) about 5 inches long by 2½ wide and ¼ inch thick, so as to exclude all air and moisture.

The pats shall be about ½ inch thick in the centre, and

## TAYLOR'S PATENT JUNCTION "

No. 12662.

For WATER CLOSETS, WATER PIPES, ANTI-SYPHON PIPES, &c.

APPROVED BY ALL SANITARY AUTHORITIES.

THIS Junction has been invented with a view to enable anyone fixing closets overcoming the difficulty of the many angles required for the various makes, also to avoid the necessity of having joints inside the walls, which is dangerous and not allowed by County Councils, Borough Engineers, Architects, &c. The 4 inch Junction can be adapted to any size from 4 inch downwards. Any plumber will see at a glance the great convenience of this Junction, as it only requires one junction for the many shapes and sizes. No Brass Thimbles or Calking required. Perfect Gas and Watertight Joint can be made in a few minutes by any ordinary Plumber. In fixing this Joint, what is necessary is to cut the Lead Pipe to the required angle, place on the loose Iron Flange, then flange back Lead Pipe ½ inch all round, coat the face of Flange with a little Red Lead Putty, bring the two Faces together and draw up with the Bolts screwing up each Bolt a little at a time until they are all tight, then the Joint is made and will stand any test. Another great convenience is:—In case of any alterations or renewal of Soil Pipes, all that is required where this Junction is used is to unbolt the same, and the Closet and Pipe leading to it are left undisturbed. With all other Junctions it is necessary to take down the W.C., break open the wall, damaging the Property and causing other inconvenience.

A—Is the front view of Junction and loose flange; the inlet being elongated, allows the lead pipe to be cut to any required angle.

B—Shows the Joint fixed and ready for tightening up, and also a few of the angles which can be got.

C—Shows the one size which can be adapted for 4 in. Soil Pipe, and a 4 in. x 1½ in. Invert Junction for Anti-siphon Pipes, &c.

D—Shows how to arrange for a small sized branch.

Made in Three Strengths—Ordinary Rain Water, ½ and ¼ Metal.

PRICES AND PARTICULARS CAN BE HAD AT ALL WHOLESALE MERCHANTS, OR FROM

CHARLES TAYLOR, R.P., Sanitary Engineer, ECCLES, MANCHESTER.

## MAUGHAN'S PATENT GEYSER

6 HOLYWELL ROW, FINSBURY, LONDON, E.C.

NEW CATALOGUE FREE ON APPLICATION.

shall be worked off to sharp edges on the four sides of the plate. They shall then be covered with a damp cloth and allowed to remain in the air until set, after which they shall be placed in vapour in the Fajja bath tank, in which the water is to be heated to a temperature of about 130 deg. Fahr. After remaining in the vapour for six hours, including the time taken to set in air, they are to be immersed in hot water, and allowed to remain there for eighteen hours. Upon their removal from the bath the samples should not be curled up, should not have fine hair cracks nor be distorted, and should not have large expansion cracks. The samples, if separated from the glass, should break with a sharp, crisp ring. If these conditions are satisfactorily fulfilled, it is believed that no free lime is present in a form that will prove detrimental. Cements, when very finely ground, even if slightly overlimed, are not so liable to blow.

#### 5. Time of Setting.

The time of setting shall be determined by noting the time required for a sample under test to bear a needle of one-twelfth of an inch diameter loaded with one-fourth of a pound, and one-twenty-fourth of an inch in diameter loaded with one pound, the mortar under test being of the consistency of rather stiff plaster or mortar. The percentage of water used shall be stated in the report.

#### 6. Tensile and Compressive Tests.

The strength of Portland cement shall be determined by testing a mixture of cement and quartz sand. The tests shall be made in a uniform manner (both for tension and compression) with briquettes of the same form and same cross section and with the same apparatus.

Neat cement. Neat tests, except where fineness, specific gravity and hot bath blowing tests are also made, are misleading as to the value of a cement. Briquettes of neat cement, in which these characteristics have been determined and found to be satisfactory, shall bear a tensile stress of 250 lbs. per square inch at the end of three days, 400 lbs. per square inch at the end of seven days, and 500 lbs. per square inch at the end of twenty-eight days. All briquettes shall be one day in air, under a damp cloth or in a damp chamber, and submerged in clean water for the remainder of the time periods. Any cement which shows a decrease in strength on or before the twenty-eighth day is to be rejected. The decisive tests shall be considered as the average of five briquettes, although for ordinary

practice two or more briquettes may be sufficient, and in the latter case only the highest test of the group is to be taken as the strength of the cement.

In determining the tensile strength of a briquette the area of the broken surface shall be measured with great accuracy, as errors sometimes exceeding 10 per cent. are possible unless such measurements are insisted upon.

Sand and cement. In sand test the sand and cement must be thoroughly mixed together while dry. After the water has been added, either for neat or sand tests, the mortar shall be thoroughly mixed for a uniform time, suitable periods being two minutes for machine mixing and five minutes for hand mixing.

Briquettes made of one part cement and three parts standard sand, in the manner described hereafter, shall stand 125 lbs. per square inch at the end of seven days and 200 lbs. at the end of twenty-eight days.

At the end of the same period the minimum compressive strength of a mixture of one part cement to three parts sand shall be 2,000 lbs. per square inch.

[Note.—Quick-setting cements generally show a lower strength than that specified above.]

The tensile strength of briquettes mixed in the proportion of 3 to 1, or of other sand briquettes, shall not show a decrease either on the twenty-eighth day or subsequently.

In every case the quantity of water used in mixing shall be stated in the report.

The quantity of water to be used in neat tests varies with the kind of cement, fineness, &c., and hence no arbitrary quantity can be specified, the correct method being to bring all mortars to the same degree of plasticity. An apparatus similar to Vicat's, and consisting of a needle having an area of 0.4 square inches weighted to about 11 oz., may be used.

"The tests are made as follows. A ring, 1½ inch in height and 3 inches in diameter, made of non-absorbing material, is placed on a glass plate and filled with the mortar to be tested, the consistency being such that the needle does not entirely pierce it." (Trans. Amer. Soc. Civil Engineers, Oct. 1893)

A simple method for determining the standard consistency of neat cement tests is to mould a ball of mortar in the hands to a plastic state and drop the same about 20 inches on to the table. If the ball of mortar neither flattens appreciably nor cracks, the consistency is satisfactory. This process corresponds practically with the previous method. The water for standard consistency of 3 to 1 sand briquettes shall ordinarily

be 10 per cent. of the sand and cement by weight. If the amount of water for standard consistency of neat cement of any particular brand be less than 20 per cent, then the amount of water for standard consistency of 3 to 1 sand briquettes for this particular brand shall be one-half of the amount used in neat tests.

#### 7. Preparation of Briquettes (a) Hand-made.

1. *Neat Cement.*—The moulds shall be slightly oiled on the inner side and placed upon a metal or glass plate. The mixture of cement and water shall then be thoroughly worked together (preferably in a Faija's mixer) for five minutes. The moulds shall then be filled well above the rim, so that the mortar presents a convex surface. With an iron trowel the mixture shall then be patted, commencing at the side, first gently and then harder until it becomes elastic and water appears upon its surface. No after addition of the mixture shall be allowed, as the briquettes must be of uniform density throughout. The superfluous cement shall then be removed and the surface smoothed by means of a knife or sharp-edged trowel. The moulds can only be removed when the cement has hardened sufficiently. The briquettes shall then be placed in a damp chamber (zinc lined) furnished with a lid (also zinc lined) to prevent the irregular drying of the briquettes under varying degrees of temperature. After a period of twenty-four hours the briquettes shall be laid in water and kept completely submerged during the whole period of hardening. The proportion of water used shall be stated in the report.

(2) *Sand and Cement.*—Five pieces of blotting-paper soaked in water shall be laid upon a metal or glass plate, and upon each piece of paper there shall be placed a mould, also moistened with water. The cement and sand in their specified proportions shall then be thoroughly mixed together, after which the water shall be added, and the whole thoroughly worked for five minutes. With the mortar thus obtained each should be filled by one application, so as to rise in a convex form above the edge of the mould. With an iron trowel the mortar shall then be patted, beginning from the side, first gently, then harder, until it becomes elastic and water appears upon the surface. No additional material must be added, as the briquettes must show a uniform density throughout. Superfluous mortar shall then be taken off by means of a knife or sharp-edged trowel and the surface smoothed.

The moulds shall then be carefully removed and the briquettes laid in a damp chamber (zinc lined), furnished with

a lid (also zinc lined) to prevent irregular drying. After a period of twenty-four hours the briquettes shall be laid in water and shall be kept completely submerged during the whole period of hardening.

#### (b) Machine-made.

1. If possible, briquettes prepared as above shall be subjected to a uniform specified pressure (say, for example, 20 lbs. per square inch) by means of a ram of the same gauge as the moulds, or,

2. A Bohme apparatus may be used. In this case the moulds shall be filled with about four-tenths of a pound of mortar, prepared as in (a), and shall be placed in the machine; 150 strokes shall then be applied to the core with a hammer of about 4.4 lbs. in weight (2 kilog.). After removing the mould and the core the briquettes shall be smoothed off, taken off the subjacent plate and treated as in (a).

By care in following the instructions given in (a) and (b) it will be found that handwork and machinework will give fairly uniform results. Doubtful cases, however, should be invariably decided by machine-made briquettes.

#### 8. Testing Machines.

Testing machines shall be of the positive lever automatic type, so arranged as to apply the loads quietly and uniformly at the rate of 200 lbs. per minute.

#### 9. Clips.

The style of clips shall be such as will break the briquette at the line of least section. Clips with adjustable rubber or paper composition rollers are found to work satisfactorily, and should be used.

#### 10. Chemical Tests.

Chemical tests and full quantitative analyses are strongly recommended, and preference will be given to cements of which analyses are furnished by the manufacturers.

#### 11. Adulterations, &c.

Any cement containing adulteration shall not be accepted as a Portland cement. There are also certain ingredients which should be strictly limited in their amount. If there is found to be more than 2 per cent. of sulphuric acid or 3 per cent. of magnesia, the cement should be rejected. It is understood that Portland cements only are being specified for. The silica or sand cements are in a class by themselves, need special specifications, and are not intended to be included in the present one.

## NEW MODEL TYPEWRITER NEW MODEL

The "LIGHT-RUNNING YÖST," so termed because of the SMOOTHNESS, QUIETNESS and SWIFTNESS of its working, is the latest model of the well-known YÖST, famous for the clearness and neatness of its writing, consequent upon its types communicating direct with the paper. Many valuable improvements have been effected, and there are some features entirely new to writing machines.

12. *Packing.*

Cement shall either be packed in paper-lined, air-tight barrels, well constructed and hooped so that, under ordinary conditions of handling, no cement shall sift out, or if in sacks, the texture of the sacks shall be so strong and fine as not to permit of any sifting out or wasting of cement under ordinary conditions of handling. The net amount of cement, deducting the weight of the package, shall be 350 lbs. per barrel.

13. *Certificate.*

The manufacturer shall give a written certificate with each shipment of cement, stating (1) the date of manufacture, (2) the tests and analyses which have been obtained at the manufacturer's laboratory for cement taken from the day's grinding of which this shipment forms a part, (3) that the cement does not contain any adulteration.

*Recommendations.*

**Frost Test on Cement.**—In case of experimental tests made for the purpose of determining the action of cements when exposed to severe frost, it is recommended that the cements be mixed at a temperature below freezing, with cold water, cold sand and kept exposed to ordinary winter weather, just as they would be exposed in actual construction of masonry. A description of what is done in this connection should be kept for comparison with other results, and the records of such experiments filed with the secretary of the Canadian Society of Civil Engineers.

It has been observed in hot-bath tests that little pustules or eruptions take place on the surface; instances are also given of the glass shattering in the hot-bath test without separating from the cement or without any other sign of failure on the part of the cement. Members of the Society are requested to observe the causes or reasons therefor, and report the same to the secretary of the Society.

Inasmuch as small consumers are rarely able to gauge or mix their test specimens with a mechanical mixer, it is advised that where tests are made by hand mixing due discrimination shall be made in comparing the results with tests made by mechanical mixing. Hand mixing done by an expert will probably agree closely with mechanical mixing, but for ordinary testing the mechanical method will give more uniform results, inasmuch as no skill or dexterity is required to produce approximate uniformity.

Cement testers, where possible, should make long time tests to see whether or not there is any connection between high early tests and future falling off in tensile strength, and whether, when mixed three to one with sand, the same or similar deterioration is observed. These tests should, if possible, be carried on for several years. It would be of the utmost value to the profession to obtain positive data on this point from engineers in charge of municipal, university or other laboratories who are in a position to supply it.

**IMPROVEMENT OF SLUMS IN LIVERPOOL.**

A LECTURE was given last week in Birmingham by Mr. Joseph B. Colton, deputy-chairman of the housing committee of the Liverpool City Council, on "What Liverpool has done with its Slums, and the Rehousing of the Displaced Population." The Liverpool Corporation realised their responsibility as long ago as 1864, when they passed through Parliament an Act known as the Liverpool Sanitary Amendment Act, which was still in force, and contained powers which no other municipality possessed and could not now obtain. The main feature of the Act was its simple procedure. The medical officer scheduled a number of back-to-back houses, and, these having insufficient through ventilation, as "unhealthy and unfit for human habitation." The schedule, which might contain from 500 to 1,000 houses, would come formally before the Council, and was passed on to the grand jury at the next assizes. After considering the report and the owners' evidence in defence of their property the grand jury would make a presentment, and the property would be condemned. The owners could compel the Corporation to buy their property, and, in the event of the parties disagreeing, an arbitrator was appointed by the Local Government Board, and his decision was final. Under this Act the Corporation had demolished about 8,000 to 9,000 houses, but it was not till 1884 that they realised there was another side to the work. Although they were knocking houses down they never thought of what became of the inhabitants, and the land was sold for business premises or to private builders, who erected houses, but let them at rents which the displaced population could not afford to pay. Time rolled on, and it was not until 1885 that Liverpool's first attempt was made at building. In December of that year Victoria Square was

opened. The building was five storeys high, and contained 269 tenements and offices. The one-room tenements let at 1s. 9d. per week, the two-roomed houses let at from 4s. 6d. to 3s., and the three-roomed at 5s. 6d. to 5s. per week. The block stood on 9,000 square yards, which for housing purposes they debited at a cost of 22s. 6d. per yard (10,125 $\frac{1}{2}$ ), and the building cost was 57,952 $\frac{1}{2}$ . The gross rental of the tenements was 2,796 $\frac{1}{2}$  16s. and of the shops 236 $\frac{1}{2}$  per annum. For ten years the actual receipt was 94 per cent., and the block paid them 2 $\frac{1}{2}$  7s. 6 $\frac{1}{2}$ d. per cent. The displaced population was not in occupation, but the dwellings which they called "artisans' dwellings" afforded a great boon to the working classes, although they presented no example of the attempt of the committee to solve the great problem. In 1890 the Juvenal Street dwellings were completed, partly three and partly four storeys high. They contained 101 tenements, comprising forty-six one-roomed let at 2s. 9d. to 2s., fifty-three two-roomed from 5s. to 3s. 9d., and two three-roomed at 5s. 6d. per week. Here the experiment was tried of a flat roof, where children might play in safety, but it was not a success. The gross annual rental was 878 $\frac{1}{2}$  17s., of which 92 per cent. has been received during the past ten years, and only 372 $\frac{1}{2}$  11s. 5d. lost in arrears. The property cost 16,166 $\frac{1}{2}$ , and paid 3 $\frac{1}{2}$  1s. 10 $\frac{1}{2}$ d. per cent. Again the displaced population did not get into occupation, and the houses were occupied by the artisan class. No further building took place until 1896 and after the city had been enlarged. A new policy was insisted upon by the increased Council, and the result was that the old procedure of demolishing the slums and turning the people into the streets without a home to go to was entirely reversed. An assurance was given that the housing committee would erect houses for the displaced occupiers and those they were turning out, and in April 1897 Gildart's Garden dwellings were opened. They were of three types comprised in five blocks, each three storeys in height, and containing eighty-eight tenements. Eighty-six houses contained living-room and bedroom let at 3s. 6d., 2s. 9d., 2s. 6d. and 2s. 3d. per week, according to the different floors; two three-roomed houses let at 4s. 6d. per week. The buildings stood on 1,685 square yards, which were valued at 1,828 $\frac{1}{2}$  16s.; the cost of the buildings was 7,687 $\frac{1}{2}$  15s. 2d., gross annual rental 643 $\frac{1}{2}$  10s., and the annual receipt 93 per cent. From 1897 to 1901 empty houses had accounted for 37 $\frac{1}{2}$  18s. 6d. per annum, and arrears for 98 $\frac{1}{2}$  14s. 8d. per annum. No one, unless he or she had lived in a slum and been displaced, was eligible to become a tenant of these houses. A sub-committee was appointed, and was

known as "the letting sub-committee," which had charge of all buildings and considered all applications. They had found that changed surroundings altered the whole family. After that experiment their policy had gone straight forward, and there was no voice in Liverpool left to advocate any other policy of building than that for the dispossessed. In April 1901 they opened the Dryden Street dwellings, comprising 182 tenements, let at prices ranging from 6s. to 3s., and the whole of these were provided with hot water. They were so built that in case of epidemic or vermin it was easy to wash the whole house, and in a few hours have the premises thoroughly cleansed. The cost of the land and buildings was 30,727 $\frac{1}{2}$ , and the gross annual rent was 1,586 $\frac{1}{2}$  4s. 4d. Dwellings in Kempston Street and Fontenoy Street had been built at a cost of 17,900 $\frac{1}{2}$  (gross rental 887 $\frac{1}{2}$  18s.), and 3,847 $\frac{1}{2}$  (gross rental 192 $\frac{1}{2}$  8s.), respectively. Altogether they had 1,618 dwellings erected or in course of erection, and they were now housing 6,540 people. There were yet 9,943 unhealthy and structurally insanitary houses to be dealt with, at an estimated outlay of 342,000 $\frac{1}{2}$ . The committee was pledged to rehouse all the dispossessed as the work of demolition proceeded, and it was estimated that this would mean the erection of 6,000 houses at a cost of 900,000 $\frac{1}{2}$ . All this vital and important work was much hindered by the Local Government Board by the short period allowed for the repayment of loans. Most of their loans were for 30 years on buildings and 50 years for land, but recently the Board had granted them 40 and 60 years respectively. The demolition work to date for interest and sinking fund had cost the city 17,100 $\frac{1}{2}$  per annum, and the rehousing, after allowing for all rents, had cost 4,200 $\frac{1}{2}$  per annum.

### BRIGHTON AQUARIUM.

ANOTHER report on the improvements proposed at the Aquarium has been prepared by a committee of the Brighton Town Council. On September 10, 1901, the committee recommended the reconstruction of the concert-room and of the fernery and waterfall; the renewal of the roof, ventilation and warming; the installation of the electric light, the improvement of the tanks and the carrying-out of general repairs and redecoration at a cost, estimated by Mr. A. Hessell Tiltman, whom the committee had consulted, at a sum not exceeding

25,000*l.* Mr. Tiltman was willing to superintend the execution of the work including the preparation of the necessary plans, &c., for the usual commission of 5 per cent. upon the total cost. The Council generally approved this scheme, and the engagement of Mr. Tiltman at a sum not exceeding 5 per cent. upon the actual outlay upon the works, his remuneration not to exceed 1,250*l.* in the whole. In February of the present year a further report was presented to the Council, which included provision for electric machinery at the Aquarium, and this increased the estimate to 29,098*l.* This amended scheme was, however, sent back to the committee for still further consideration, and after consultation with other members of the Corporation and Mr. Tiltman, the latter was instructed to report with an estimate of the cost of putting the building into structural and decorative repair. The result was that on April 24 a new proposal from which "all important structural alterations were omitted," and the cost reduced from 29,098*l.* to 15,100*l.*, was before the committee, but a decision was not arrived at, and Mr. Tiltman was once more instructed with regard to the alteration of the building.

Many attractive features are embraced in "Scheme No. 5," which, under date of July 21, 1902, Mr. Tiltman has submitted to the committee, who, however, while submitting the plans to the inspection of members of the corporate body, are unable to recommend their adoption. Under the latest proposals, to carry out which the architect suggests the sum of from 38,000*l.* to 40,000*l.*, it is proposed to remove the whole of the existing skylights, balustrading and buildings at the present terrace and Madeira Road levels, and upon the disappearance of these to erect a large glass-covered avenue or arcade, in which on one side provision would be made for a large number of lock-up shops. Mr. Tiltman thinks that these should be congregated together, be well arranged, and suited for the sale of light and fancy goods. On the other side of the arcade would be suitable accessories, such as a music annexe, café restaurant, tea and palm houses, ferneries and arbours, while the remaining portions of the site at this terrace level could be concentrated and utilised as an outdoor promenading space, with outside bandstands, café, tea gardens, seats, playing fountains, ponds, and the like. The arcade would be 554 feet in length, and will be glazed on the top and on the southern side in such manner as with suitable warming, &c., to serve as a sheltered and agreeable resort in the winter months, while in the summer, with all the doors on the southern side thrown open the greater part of its length it would be, Mr. Tiltman thinks, an equally

attractive promenade. Artificial lighting and ventilation during the day as well as night throughout the institution is spoken of, and the upper part or terrace level (the area of which would be largely increased by the omission of all sky lights) has been dealt with as a place of free admission throughout, and by the treatment of the upper portion, the Aquarium part, the report states, must necessarily be relegated more to functions of an educational institution, for which a small fee would be charged.

Little or no structural work was proposed under the scheme in the Aquarium itself, with the exception of the covering in of the openings now occupied by the sea-lion house, inclined ways, skylights, &c., the reversion to its old effect of the water-fall, the lowering of the ceiling of the present concert-hall and the utilisation of its site for further piscatorial exhibits, and the general simple decorative repair of the interior.

It is proposed, however, that the present "ugly and ill-arranged entrances" should be removed and one entrance substituted for the Aquarium, one to the covered way to the arcade and the other to the open path by way of the terraces. The cost of an attendant would, however, be saved, as the three entrances would be controlled from one pay box, and combined with the entrances would be shelter places, where visitors might in inclement weather wait their admittance to either of the two now separated establishments. These waiting spaces would be so arranged that in stormy weather they might be enclosed on any side with rolling screens, thus affording shelter from wind and rain, and also allowing the space to be closed at night. The necessity for the alteration of the present plan at this point enabled Mr. Tiltman to secure a well-grouped entrance-block "more worthy in design of the purposes of the proposed dual establishment." The terraces would be levelled throughout, reasphalted outside and suitably paved inside, fitted with ponds, fountains, &c., all formed of majolica, and the new buildings would be constructed both in walls and roofing largely of steel and iron, contrasted by certain portions in plain brickwork, and copper sheet roofing. The terraces would be liberally provided with verandahs, seats, shrubs, plants and playing fountains; "and, in fact," adds Mr. Tiltman, "the whole buildings and ground would be treated structurally and decoratively in a manner to be attractive in expression and not extravagant in its upkeep." The committee, who recommended that Mr. Tiltman be paid 500*l.* on account of his commission, hope to be in a position shortly to report to the Council with recommendations for the execution of necessary repairs to the Aquarium.

# ARMOURLED FIRE DOORS

Telephone,  
No. 143 Westminster.

Telegrams,  
"Sprinkler, London."

Officially Endorsed by the Fire Offices Committee.

Lighter and Cheaper than Iron Doors.

Can be made to Close Automatically in Case of Fire.

Will NOT Buckle or Twist out of Shape.

## STEAM HEATING INSTALLATIONS, HIGH AND LOW PRESSURE. VACUUM SYSTEM.

Water Softening and Purification.

Feed Water Filters.

GRINNELL AUTOMATIC FIRE EXTINGUISHING INSTALLATIONS.

**MATHER & PLATT, L<sup>TD</sup>.** (into which is merged DOWSON, TAYLOR & CO.),  
Park Works, Manchester; and 14 Victoria Street, London, S.W.

# The Architect.

## THE WEEK.

It was announced on Wednesday that His Majesty the KING has been graciously pleased to approve the appointment of Sir BENJAMIN BAKER, K.C.M.G., to be a Knight Commander of the most Honourable Order of the Bath, in recognition of his services in connection with the construction of the Nile reservoir. The KING has also been pleased to give directions for the following promotions in and appointments to the Most Distinguished Order of Saint Michael and Saint George, in recognition of similar services:—To be an Ordinary Member of the First Class, or Knights Grand Cross: Sir WILLIAM EDMUND GARSTIN, K.C.M.G., Under-Secretary of State for Public Works in Egypt. To be Ordinary Members of the Second Class, or Knights Commanders: Major ROBERT HANBURY BROWN, R.E., C.M.G., and Mr. WILLIAM WILLCOCKS, C.M.G., of the Egyptian Irrigation Department. To be an Honorary Member of the Second Class, or Knights Commanders: HUSSEIN FAKHRY PASHA, Egyptian Minister of Public Works. To be Ordinary Members of the Third Class, or Companions: Mr. ARTHUR LEWIS WEBB, Mr. KYNASTON EDWARDS VERSCHOYLE, Mr. MAURICE FITZMAURICE, Mr. GEORGE HENRY STEPHENS. Some disappointment is sure to be caused owing to the absence of the name of Sir JOHN AIRD, M.P., or of any of his representatives from the list of honours. It would be an error, as SHAKESPEARE says, "to forestall prescience and esteem no act but that of hand." At the same time, the enormous responsibilities which rested on the contractors deserve recognition. If a mistake in the plans arose or in any of the preliminary arrangements the Egyptian mind would be indifferent, but the slightest failure in the masonry of the Assouan dam would mean a loss of English prestige. There is no doubt that precedent has been followed, but that makes the case more to be regretted. If contractors are to be judged no more deserving of distinctions than the machinery they employ, it cannot be expected that they will take more than a financial interest in their works.

ALTHOUGH architects must always desire to see regulations enforced which will put a stop to defective building, or at least will restrain some of its inconveniences, they cannot deny that the elasticity of the by-laws which are now supposed to form a standard system of building should be amended. The official world always thinks of the letter rather than the spirit of a regulation, and by-laws which should be altered to suit circumstances are administered as if they were as inexorable as the old edicts of the Medes and the Persians. A meeting was held on Monday at 29 Bloomsbury Square, at which several architects attended for the purpose of endeavouring by means of association to obtain some relief from the ultra-rigid system which is now enforced. The following resolution was adopted:—"That, in consequence of the general complaints about the oppressive nature of the model by-laws (drawn up originally to meet the needs of urban districts only) in rural districts or rural portions of urban districts, it is thought that the time has come for the formation of an association or the purpose of drawing public attention to the matter, and it is hereby resolved that an organisation be now formed, to be called the Building By-law Reform Association, to promote amendments of building by-laws so as to limit official control of private buildings to that only the public health and safety demand, and thus remove encroachments on individual liberty." The resolution is sufficiently expressive. The by-laws when originally drawn up were believed to need modifications which were suggested by local authorities. Instead, however, of seeking some latitude in order to suit local circumstances, efforts have been made to give even more rigidity to the regulations than was contemplated in the draft schemes. It is no doubt much easier for assistants to have a hard-and-fast system which will not require the exercise of any judgment for its adaptation to meet particular cases, but something else should be calculated besides their convenience.

GENERAL practitioners in medicine usually decline to give particulars of their charges, or even to state the number of times they have visited a patient. An architect's account is presumed to offer less difficulty to those who wish to examine it, for it is taken to be at the most 5 per cent. on the outlay. When it is found that an account will not work out at that rate there is discontent. An example of the difficulty which people find in recognising any other basis was presented at some late meetings of the Guardians of Newton Union in Devonshire. New works were to be carried out in connection with the workhouse. For that purpose it was necessary to make plans of existing buildings, which were to be removed in order to furnish part of the site. Mr. SEGER, the architect for that survey, claimed seven guineas. Some of the Guardians, including the chairman, declined to approve of the account, on the ground that the 5 per cent. commission was to include everything. The chairman repeatedly asserted that there should be only one charge, 5 per cent., and that he had never heard before of payment for plans of sites. However, the good sense of the majority prevailed, and the charge was admitted. It is hard that gentlemen holding administrative offices know so little of architectural practice as to imagine it is of so simple a nature that one charge can cover the vast variety of incidental work which may arise, and which the architect can no more be compelled to execute than to discharge the functions of a lawyer in connection with the building.

THE competition for signs in Paris has terminated. That kind of contest does not appear adapted to French dispositions, and the announcement of prizes was at once received with dissatisfaction. The first award of 2,000 francs has been made to M. ADOLPH WILLETTE, whose name was associated with the Chat Noir. Indeed, one of his works was a sign which served for that cabaret. The two premiums of 1,000 francs each were awarded to M. ABEL TROUCHET for three signs, two of them being luminous; and M. J. H. AVY for a sign part of which was in forged iron. Five prizes of 500 francs were also given. They were obtained by MM. SARAZIN, SAUVAGE and RÉGIUS for signs in hammered iron, M. E. SCHENCK for a sign in iron and copper, M. FRANK SCHEIDECKER for a sign in copper repoussé, M. DERRÉ for two signs in plaster, and M. TESTARD for two cut from plate-iron. Six prizes of 250 francs were also awarded to MM. RÉGIUS & BOCHE, M. PERRAUD, M. PRIGNOT, M. MERCIER, M. D'HIERE and M. MOREAU-VAUTHIER. In addition several silver medals were awarded.

It was announced that the Venetians did not appeal for aid to other countries in order that St. Mark's Campanile could be re-erected. That declaration was creditable to the people, and suggests that Italy is becoming self-reliant. An appeal was, however, made by the Royal Academy, and Academicians and Associates had given donations. There has been some conversation between the president, Sir E. J. POYNTER, and the Sindaco on the subject, and as a result a letter has been sent to Mr. T. G. JACKSON, R.A., the treasurer of the Academy, from Venice. In the letter Count GRIMANI willingly accepts in the name of the Commune of Venice the action of the Royal Academy in appealing for material aid towards the reconstruction of the Campanile and Loggia of SANSOVINO, and will receive with gratitude the contributions from artists and dilettanti which are collected; he only stipulates that the contributions shall be given and received as offerings from individuals, and be accompanied by the names of the contributors, in order that there may be no appearance of a public subscription, which it would be unbecoming in the Italian nation and the city of Venice to receive. Sir E. J. POYNTER accordingly makes "a further appeal to artists, and to all those whose love of the beautiful has led them to Venice, to join in swelling this list, that the Royal Academy may be able to forward a contribution worthy of the numbers who yearly flock to that treasure house of all that is most exquisite in art, as an evidence of their genuine sympathy with the Venetians in their loss."

PAINTERS' ARCHITECTURE: TITIAN.

### RUSKIN AND TURNER.\*

THE appearance of the pamphlet entitled "Notes on the Turner Gallery, Marlborough House," at the end of 1856, enabled a great many people for the first time to realise the character of JOHN RUSKIN as a writer. It was the earliest publication bearing his name which was obtainable at a shilling. Poems by him had been read in annuals and essays in a few magazines. The first volume of "Modern Painters" was published in 1843, but it and the succeeding volumes were expensive. "The Seven Lamps of Architecture," "The Stones of Venice," were only meant for a few, and were considered to be professional treatises. In the Notes on the TURNER pictures he gave extracts from "Modern Painters," and in that way enabled the general public to form a notion, it may be an inadequate one, of his ability as a writer. Many of his characteristics were evident. It was manifest that he was most laborious in obtaining information, and his criticism was based on a study of pictures which might be called microscopic. It could be seen, too, by his remarks on some of TURNER'S works, that he was as close a student of mountain scenery as if he intended to become a painter or a geologist. The appendix, which related to the protection of pictures and the arrangement of picture galleries, also suggested that he was no mere amateur. In fact, the RUSKIN of that time was to be inferred from the pamphlet of eighty-eight pages. On that account it was no wonder the Notes were quickly bought up, and in the course of the year no less than five editions of it were brought out, a success which is unprecedented in the history of catalogues.

As a large part was derived from "Modern Painters," we can understand RUSKIN'S objection to reprint it among his miscellaneous writings. It is now being published with a catalogue of TURNER'S water-colour drawings and various other notices by him in a handy volume uniform with the cheap edition of RUSKIN'S works. The book has been edited by Mr. E. T. COOK, not in the way which is now becoming common, that is, writing a short preface with some general remarks about the subject that is treated. Mr. COOK supposes the Notes will be used by students of the TURNER collection; and he has endeavoured by cross-references and remarks, as well as by a comprehensive index, to make the volume such that it can be made use of both in the National Gallery and for reflection afterwards.

The majority of our readers are no doubt aware that, according to RUSKIN, there were four periods in TURNER'S career, during each of which he wrought with a different aim or with different powers. Born in 1775, admitted to the Academy schools in 1789, and elected an associate in 1799, it is assumed that his student period did not begin until 1800 (the earlier years were afterwards described as "development"), and then continued till 1820. During that time he imitated successively the works of the various masters who excelled in the qualities he desired to attain himself. But it is pointed out that though an imitator, TURNER

was not a copyist:—"Instead of copying a VANDEVELDE, he went to the sea and painted *that* in VANDEVELDE'S way. Instead of copying a POUSSIN, he went to the mountains and painted *them* in POUSSIN'S way. And from the lips of the mountains and the sea themselves he learned one or two things which neither VANDEVELDE nor POUSSIN could have told him, until at last, continually finding these sayings of the hills and waves on the whole the soundest kind of saying, he came to listen to no others." The second period was between 1820 and 1835, in which he applied the principles he had acquired, and sometimes endeavoured to produce beautiful compositions or ideals, instead of transcripts of natural fact. In the third period, which continued till 1845, he reproduced as far as he could the simple impressions he received from nature, associating them with his own deepest feelings. In 1845 his health gave way, and his mind and sight partially failed. The pictures produced from that time to his death in 1851 are wholly inferior in value. The works which mark the period of central power are the *Ulysses*, a ship entering on its voyage, and the *Old Temeraire*, a ship closing its voyage for ever.

In describing the pictures selected RUSKIN was not afraid to point out their deficiencies. Thus the *View in Wales*, because it was supposed to be in WILSON'S manner, "has not a single Welsh character," and some careless scratches in the foreground give occasion to praise Heaven, "for," says RUSKIN, "there is an impatience of genius as well as a patience—and woe worth the man who could have painted such a picture as this without being tired of it." Again, in *The Shipwreck* it is observed that TURNER'S large waves are always deficient in lustre and liquidity, and he was unable to express the construction or softness of foam. When in 1842 he was over-liberal with foam in his *Snowstorm*, of which he was an observer, being on board the *Ariel*, it was condemned by the critics as mere soapsuds and whitewash. Apropos of some of the Italian views, it is said that they present the worst possible example of TURNER'S colour, for "neither in his actual views of Italy has TURNER ever caught her true spirit except in the little vignettes to ROGERS'S poems; none of his large pictures at all equal them." In his description of the *Ulysses Deriding Polyphemus* he does not pass over the error by which the Cyclop's cave is made too small; "considering that TURNER was at this time professor of perspective to the Royal Academy, and that much outcry has lately been raised against supposed pre-Raphaelite violations of perspective law, I think we may not unwarrantably inquire how our professor supposed that *that* Cyclops could ever have got into *that* cave." He is no less sarcastic about the gorgeous Lord Mayor's barges becoming representative of the Homeric black ships. The *Regulus Leaving Rome* is declared to be very disgraceful to TURNER, and is a wicked relapse into the old rivalry with CLAUDE. The *Bridge of Sighs*, which so many have admired, is condemned as one of the worst of his later pictures, for at the time "he had quite lost the power of painting architectural detail, and his feeling for Gothic architecture had never at any period of his life been true, owing to his early education among classical models."

\* *Ruskin on Pictures*. A Collection of Criticisms by John Ruskin not heretofore Reprinted, and now Re-edited and Rearranged. Vol. I. Turner at the National Gallery and in Mr. Ruskin's Collection. (London: George Allen.)

The second catalogue may be less eloquent, but it is more interesting in a biographical sense. RUSKIN was commissioned by the Trustees of the National Gallery to prepare three hundred examples of TURNER'S drawings from nature for exhibition. An enormous amount of labour was involved in the classification, but RUSKIN did not spare himself, for he had a strong conviction of the value of such an exhibition as a means of artistical education. They were not appreciated; he did not mind his own wasted time, but it was a frightful discovery for him that "the most splendid genius of the arts might be permitted to labour and perish uselessly." The second catalogue, therefore, reflects RUSKIN in his most sanguine mood. He was learning his business, as he said, in the preparation of the drawings, and the illustrative notes to the catalogue enable us to perceive the effect of TURNER'S drawings in influencing his growth. He took it for granted that every stroke of TURNER'S had a meaning, and he pondered until he had ascertained, as he thought, what that meaning was. "You cannot admire, nor even see TURNER, until your admiration shall consist primarily in recognition of the facts he represents, as being facts known to you as well as to him." This is true not of TURNER only, but of all great artists; but especially of TURNER, in so far as every one of his pictures is a statement of new facts, so that you must take another day's hard work with nature before you can read it (other artists representing the same thing over and over again). TURNER was very jealous about anybody watching him at work, for he was strong in insular selfishness, and had no wish to impart his discoveries to others. It is therefore very interesting to watch the efforts made by RUSKIN in order to explain the mysterious success of many of the artist's drawings. All this might have been obviated by a little communicativeness on TURNER'S part. His manner of sketching throughout life is defined by RUSKIN in one place as "the utmost possible quantity of information put into the smallest possible space, but *always* arranged for a perfect picture."

The notes on the exhibition of TURNER'S drawings belonging to Mr. RUSKIN, and on the copies by himself in that artist's style, are also given. As they were written in 1878 they express RUSKIN'S views at a time when his mind had gone through many revolutions. He expresses his experience when he says:—"As in my own advancing life I learn more of the laws of noble art, I recognise faults in TURNER to which I was once blind; but only as I recognise also powers which my boy's enthusiasm did but disgrace by its advocacy." The grouping of TURNER'S periods becomes somewhat different. The first is schooldays from 1775-1800; the second, rock foundations, Switzerland, between 1800-10; the third, dream-land, Italy, 1810-20; the fourth, reality, England at rest, 1820-25; the fifth, reality, England disquieted, 1825-30; the sixth, meditation, England passing away, 1830-40; the seventh, minstrelsy, the passionate pilgrim, 1830-40; the eighth, morning by the riversides, 1830-40; the ninth, again the Alps, 1840-45; and the tenth, sunset, 1840-45. It is possible that in some of those periods Mr. RUSKIN was describing the changes in his own life. Thus the seven drawings of the "Passing-away" group show a cathedral, four castles and two abbeys. "The reader," remarks RUSKIN, "may suppose that I chose them from my love of architecture, but they have come to me as fate appointed." He goes on to say:—"Every one of the seven was composed by TURNER to do honour to some of those buildings of which it is England's proud boast that she needs no more. And instead of cathedrals, castles or abbeys, the hotel, the restaurant, the station and the manufactory must, in days to come, be the objects of her artists' worship. In the future England and Wales series the Salisbury terminus, the Carnarvon buffet, the Grand Okehampton Hotel and the United Bolton Mills will be the only objects thought deserving of portraiture. But the future England and Wales will never be painted by a TURNER." The words were written in a pessimistic spirit, but they suggest the end of an era of which TURNER and RUSKIN might be selected as representatives.

Mr. COOK has already shown his knowledge of RUSKIN by his "Studies," which is one of the best books on the writer, artist, professor and reformer. It would be im-

possible for anybody who had not already endeavoured to grasp the manifold qualities of RUSKIN'S nature to edit the notes and catalogues in the manner it has been done, although from the modesty of the claim it may be suspected of being little more than a mechanical office. The relationship between RUSKIN and TURNER was remarkable, if not unique. The majority of art critics have no personal interest in artists, whom they look on as mere producers, and often do not esteem as men. In a mysterious way TURNER became the means of drawing forth powers in RUSKIN which the votary of the painter did not anticipate. Both enjoyed the same scenes in Switzerland, and the terror which belongs to the sublime was impressed by the views of the mountains on both. TURNER expressed what he felt in noble drawings, but in RUSKIN it resulted in efforts to transform the character of the world. Indeed, in all literature there are few things more curious than to find RUSKIN, who had soared so high with TURNER, coming to the conclusion that the formation of a new charity organisation should be the aim of every superior man. "If we help to feed and clothe and lodge people, then we may be rewarded by becoming more dexterous in art." What he taught he practised, and there was no boasting or cant when he said, "I myself have washed a flight of stone stairs all down, with bucket and broom, in a Savoy inn, where they hadn't washed their stairs since they first went up them, and I never made a better sketch than that afternoon."

Mr. COOK, by his arrangement of the notes and the extracts from RUSKIN'S works, causes the volume to be more expressive of RUSKIN than any other volume in the series. There are several illustrations of the most prized of TURNER'S drawings, including the *Splügen Pass*, which was presented to RUSKIN by his friends, and the volume must satisfy the most exacting of RUSKIN'S admirers.

#### THE ENCYCLOPÆDIA BRITANNICA.\*

THE expedition with which the early volumes of the new edition of the "Encyclopædia Britannica" were issued appears to be increased as the end of the series approaches. The whole can now be arranged for by those who may wish to make 1902-3 memorable for individuals or public institutions by presenting the Encyclopædia as a Christmas or New Year's gift. It may be said without the least exaggeration that for such a purpose it would be impossible to find anything which is likely to be equally useful in promoting general knowledge.

The prefatory essay is by Professor KARL PEARSON, F.R.S. The subject is the Function of Science in the Modern State. The object of the essay is to show how in our time there is a struggle for existence between nations as well as between individuals, in which the combined capacity of each people must be directed in such a way as to become effectual. With that view teachers may be considered as captains of industry. Unfortunately, with us little attention has been devoted to their training. There is much which is sarcastic, and yet at the same time merited, in Professor PEARSON'S essay. As he points out, it is only in England that the offer of teaching posts to wranglers immediately after the appearance of the class lists would be accepted as sensible. For, he says, to give a man "control of a higher craft school because he has taken a brilliant university degree in pure science is a common illustration" of the present chaos in technical education in England. In the higher class schools or colleges there is the same absence of recognition of what is necessary, for "we have started again on the wrong system, multiplication of little centres doing their individual best, no doubt, but not what is best for the nation." The essay is thoroughly outspoken, and should receive attention from those who are responsible for the education of the country.

There are several articles which will be found interesting

\* The new volumes of the *Encyclopædia Britannica*, constituting in combination with the existing volumes of the ninth edition the tenth edition of that work, and also, supplying a new, distinctive and independent library of reference, dealing with recent events and developments. The eighth of the new volumes, being volume xxxii, of the complete work. (Published by the *Times*, London.)

to those engaged in construction. Stone cannot yet be dispensed with in building, and a contribution by Dr. MERRILL, the New York State geologist, describes the extent to which in America machinery is used to cheapen the operations of quarrying. He says:—

In limestones and marbles, and in the softer sandstones, channelling machines driven by steam are employed, by which vertical or oblique grooves can be cut with great rapidity to a depth of several feet. A level bed of rock is cleared, and on this are laid rails, along which the machine moves. After the channels are cut, a row of holes is bored perpendicular to the former at the desired distance below the surface of the bed, and by driving wedges into these the required blocks are separated. When the beds of stone to be quarried are thin, and when to remove the whole of the overlaying mass of earth or rock would be too expensive, it is found convenient to treat the quarry as if it were a mine, and to rely on methods similar to those practised in mining. A horizontal bed of rock is usually opened at its outcrop on some hillside. If this is impracticable, a shaft or stope is excavated to reach it, and if dimension stone is required, a deep horizontal groove is cut near the top or the bottom of the bed. The quarry face is then divided into blocks by saw-cuts, channels, or rows of drill-holes, and the blocks are separated by wedging or blasting. As the excavation progresses, portions of the rock are left in place as pillars to support the roof.

Railways are dealt with by a dozen specialists, by whom not only methods of working and construction are explained, as exemplified on the different lines, but such subjects as economics, legislation, accidents, finance, &c. Owing to the sound construction adopted in the early days in England, it is now more difficult to introduce improvements into this country than on the more elastic lines of America and on the Continent. River engineering is treated by Professor VERNON-HARCOURT, who includes such late works as the movable frame weirs on the Seine and the Spree, and the lifting-gate and weir at Richmond. In the article on Road-making it is pointed out that whereas brick paving has been in use for twenty years in America, in the United Kingdom, although bricks are produced unequalled for hardness and finish, no serious attempt has been made to introduce a tough brick for roadways that will neither chip nor wear smoothly. Another important variety of construction, viz. Ship-building, is dealt with by Mr. P. WATTS, the Director of Naval Construction.

Social progress in Great Britain is another of the subjects in which several writers have co-operated. Canon BARNETT sets forth modern efforts to deal with the housing of the working classes. From the statistics given it is shown there is a tendency now among the humbler people to move to the outskirts. The author appears to believe that overcrowding is due chiefly to insufficient means of locomotion. Sociology is also considered for the first time in a separate article. It might be taken as an introduction to Professor PEARSON'S essay, for it is also concerned with the State as an organic whole. To a great extent the most advanced parts of the world appear to be returning to Greek ideas.

Art has to be recognised in all the volumes of the Encyclopædia. "Schools of Painting" describe the British, French, Belgic and those in other European countries, as well as in the United States. Professor VAN DYKE declares that the history of painting in the United States is almost entirely a nineteenth-century production. COPLEY, the father of Lord LYNDHURST, lived until 1815; WEST until 1820. The style resembled that of the British school. The middle or second period began with DOUGHTY and COLE. In the latest school French influence is most apparent. We are told that "from their French training many of the American artists have been charged with echoing Parisian art, and the charge is partly true. They have accepted French methods because they think them the best, but their subjects and motives are sufficiently original." It is also remarked of Mr. WHISTLER, who by birth is an American, that "he is an example of the modern man without a country. No nation can claim him as an artist because he seems to have no nationality." It is not, however, said that Mr. WHISTLER or artists who are equally cosmopolitan, suffer because they believe that art, like capital, is of no one country. In describing the British school Mr. SPIELMANN narrates the changed conditions in collecting

works of art. Examples of old masters are preferred by many. It is concluded that "to a wide appreciation of all types of pictorial art has succeeded a grudging and careless estimate of the value of the bulk of artistic endeavour. Only a few branches of production are still encouraged by anything approaching an efficient demand. Portraiture is the mainstay of the majority of the figure painters." It is evident the sociological aspects of the case demand more consideration than they have received. We cannot have progress if living artists are sacrificed to the dead, nor can we compete with foreign nations if in so important a class of work as painting the country can only point to the labours of a past age. There is little doubt that occasionally a modern painter in England, by catering for a limited class of people, may obtain higher prices for his works than they merit. But those cases are few, and they are less injurious, perhaps, than the paying of enormous sums for the portraits of a courtesan of a former period. The companion article on Sculpture relates mainly to the English and French schools, and is amply illustrated with photographic views.

Among the biographies is one of Mr. R. NORMAN SHAW, R.A. In describing his works it is said that New Scotland Yard is the finest and most complete. In conclusion, it is stated "it is largely owing to him that there is now a distinct tendency to approach architecture as the art of building rather than the art of designing, and the study of old work as one of methods and expressions which are for all time, rather than as a means of learning a language of forms proper to that period." Among the other artists whose biographies appear in the volume are PUVIS DE CHAVANNES, DANTE ROSSETTI, Sir W. B. RICHMOND, THEODORE ROUSSEAU, GIOVANNI SEGENTINI, W. B. SCOTT, &c.

Archæology is not neglected. The article on Roman Walls suggests the diminished certainty about the history and character of the great wall in Britain. JONATHAN OLDBUCK would be amazed to find it stated that "the vallum can no longer be explained as of old, but it is still a puzzle." Silchester is described, and several plans enable the reader to realise the arrangements of the Roman houses. The latest explorations in Rome are described by Professor NORTON. SCHLIEMANN'S discoveries are narrated by Mr. D. G. HOGARTH.

The variety and interest of the contents of the Encyclopædia continue undiminished, and possessors will have the satisfaction of knowing that equal care has been taken throughout, and from the uniformity of excellence the relative value of the volumes is beyond calculation unless by means of personal preference.

## THE SOCIETY OF ARCHITECTS.

A MEETING of the Society of Architects was held last evening at St. James's Hall, Piccadilly, when the following paper was read by Mr. Ellis Marsland, hon. secretary, British Fire Prevention Committee:—

### Recent Conflagrations and their Lessons to Architects.

In selecting this subject for our consideration to-night, I feel I shall be met by the covert observation that it is not to the interest of architects that the burning of buildings should cease; but, on reflection, I think we must all look upon fires as calamities if possible to be avoided, especially as they are sometimes attended by loss of life, and, from an economic point of view, a waste to be deprecated, and any suggestions for their limitation and control well worthy the consideration of professional and practical men.

I have selected for comment to-night two conflagrations. A continental one at Antwerp, and the other the more recent Barbican fire.

The first of these is the fire which destroyed the Entrepôt Royal, or the Government bonded warehouses at Antwerp, on June 5, 1901.

A few notes of the building, its size, position and contents may assist us to realise the magnitude of the conflagration.

The warehouses consisted of a series of buildings in three main blocks, each six storeys in height, fronting the Quai de l'Entrepôt, and designated the North Central and South Block, and connected in the rear towards the Avenue du Commerce by buildings of lesser height; there were, in addition, a number of one-storey buildings. The buildings dated from 1830, and were erected with brick walls treated architecturally with stone, but with no claim to be of fire-

resisting construction. The floors were principally of wooden joists carried upon wrought-iron girders and supported by cast-iron columns. The floors were carried on columns independently of the walls, but the ends of the wrought-iron girders were let into the walls and connected on the outside by plates and washers. This accounts to a large extent for the so complete destruction of the buildings, inasmuch as the falling of the floors and ironwork dragged the walls over and brought about the total wreck.

There were cross walls dividing the buildings up into sections, but these terminated below the roof, had many openings in them imperfectly closed with badly-fitting single iron doors, and in some cases with none at all. The staircases were of wood.

The buildings were used principally for the storing of bonded goods, such as coffee, sugar, wool, tobacco, tallow, hardware and fabrics, but some of the floors were let to private tenants, and it was in one of these tenancies the fire commenced. The exact spot was on the top floor about 24 metres from the ground, and it spread along the roof in either direction.

The whole of these buildings, practically all communicating and adjoining and filled with most inflammable materials, were little calculated to resist the spread of fire, and in addition to this, the fire starting in the roof storey, the extinguishing appliances were unable, through want of water-pressure in the hydrants and the want of more powerful engines, to touch the fire until it reached the lower storeys.

The fire occurred, as before mentioned, on June 5, at 2.30 P.M.; the brigade were called at 2.40 P.M., and at 4.30 P.M. the buildings of the central and south blocks were well alight, and by 6 P.M. the whole of the roofs and floors had fallen and were a burning ruin, which was not extinguished for many days after. The only portion saved was the north block. The northerly breeze which was blowing assisted the efforts of the brigade in preventing the flames leaping across the courtyard, although in the other direction it greatly assisted in the spread of the fire.

I think the moral of this fire is, Do not put all your eggs into one basket, but divide up your buildings into sections by division walls, and if you have openings see that they are closed by efficient double iron doors; also if you have a building 24 metres high see that your fire appliances will reach a fire in the top storey.

To business men a fire is always a calamity to be guarded against, and although one may be insured against the loss of premises, stock and rent, yet the inconvenience caused to and the dislocation of one's business is to be deplored and avoided if it be possible.

In these buildings not one I think had any pretensions to be fire-resisting, and their total destruction under the circumstances is small matter for wonder, nor is the architect entirely to blame.

If he suggest to his client fire-resisting construction, he is met by some or all of the following objections:—

1. Why should I build my premises of fire-resisting material if the insurance companies will make no difference in the amount of premium between a fire-resisting building and a combustible one?

2. Why should I build to resist fire if my neighbour is not compelled to do the same, and his building igniting sets fire to mine?

3. Why should I build to resist fire if by reason of the increased cost of my building my assessment is increased?

These are all, of course, very pertinent objections, and with regard to the first, the insurance companies not being philanthropic institutions, but existing for profit, do not as yet see their way to make any material reduction, as in a large conflagration the result more often is the complete destruction of both classes of building. The fire spreads through the windows, either those fronting the streets or those looking into the light courts. Does not this suggest that all these openings should be protected by iron or hard wood shutters, or by asbestos blinds, and that all these should be closed every night at the conclusion of business as a matter of ordinary routine? I do not, of course, say that this method would prevent the spread of fire entirely, but it would retard its progress so as to enable the fire brigade to surround a fire instead of having to go in all directions, following outbreak after outbreak, by reason of the fire travelling through window openings. We are sometimes tempted to be dissatisfied with our fire appliances, but given a good stiff breeze, as happened on the occasion of the Barbican fire, how are you going to cope with fires breaking out in all directions and on all floors at once by reason of the glass in the window openings giving way and carrying the flames through? Look at New Zealand Avenue with its *cul de sac* and large area of opening; the fireman has not half a chance, and the wonder is not that the fire was so large, but that it was confined to such comparatively small limits through the indomitable perseverance of the brigade.

If, as I suggest, insurance companies could be persuaded

to countenance this form of protection and reduce their premiums to those clients who adopted them, it would be, I think, to their advantage, or there might be legislation on this head making this form of protection compulsory. Objection has been urged that if premises are so straightly shut up it would perhaps be difficult to detect a fire in its incipient stage, but it is then your automatic alarms and sprinklers would come in. We have also in lieu of shutters a recent invention in the form of wired glass, with which the windows could be glazed into metal or hard wood frames or directly into stonework or brickwork.

The second objection could of course only be dealt with by legislation, and if this were desirable certain sections or zones of a city which are devoted to buildings of the warehouse class might be compelled to be of fire-resisting construction, and rules framed for such, penalties also being levied against those who by their indifference or carelessness endanger their neighbour's property.

In Germany, I understand, a man is made personally liable if it is found after a fire he has neglected any of the precautions against it he is bound by law to take. Without, perhaps, going quite so far as this, a man, for instance, who neglects to see that any opening in which fire-resisting doors are fixed is not closed every night at the conclusion of the day's work might be liable to a penalty. At present the law provides for doors in a party wall under certain circumstances, but does not provide for them to be closed when the premises are vacated, thus in many cases rendering them inefficacious. Neglecting to provide proper exits in case of fire might also be the subject of personal responsibility, as it would conduce to greater caution on the owner's part if he were made personally responsible for the safe exit of his employees in case of fire.

The third objection is one which is of great importance, and it appears to me that if a building owner, by reason of additional expense, renders his building fire-resisting, he renders a service to the community, and should in consequence have his assessment reduced instead of increased. If municipalities would only look at this point in the right light they would see that a citizen who aims at fire resistance in his building is a public benefactor, as he tends to reduce the precautions which are now necessary to be taken by the municipality to protect the community from fire and loss, and thus save expenditure, and this is a point in the incidence of taxation well worthy the attention of corporations.

The fire started either in Nos. 8 and 9 or 10 and 11, Barbican, and spread to the right and left; then the flames were carried, by the stiff breeze that was blowing, across the road to New Zealand Avenue, a *cul de sac*, along which it spread on either side until it was stopped by the wall at the end enclosing the low building of the horse repository.

The call was given at 10.41 P.M. on April 21, 1902, and the stop at 12.45 A.M. the next day.

As the result of this fire, I should like to make the following suggestions for buildings of the city warehouse class:—

That all supporting piers should be constructed, where practical, of brick.

That all roofs should be flat and of fire-resisting construction.

That all windows should be protected by fire-resisting shutters or wired-glass.

That all floors should be fire-resisting, and all iron girders, columns and supports be protected by special plaster or hollow tile covering and not tied into walls.

That all staircases be enclosed by at least a 9-inch wall carried up to the roof, and any openings on to the same be filled with fire-resisting doors.

That all lifts be enclosed with at least a 9-inch wall and carried up through the roof and covered with a skylight of light iron and glass, and all openings on to the several floors be filled with fire-resisting doors.

I feel assured that if the above-mentioned precautions were taken, coupled with the promptitude with which the fire brigade arrives on the scene, a fire would be confined to the building in which it originated, and a large amount of loss and inconvenience averted.

#### SOCIETY OF ENGINEERS.

THE forty-eighth annual general meeting of the Society of Engineers was held on Monday, December 8, at the Institution of Mechanical Engineers, Storey's Gate, Westminster, by kind permission of the President and Council of the Institution.

The chair was occupied by Mr. Percy Griffith, president. The following gentlemen were duly elected by ballot, as the Council and officers for 1903, viz.:—As president, Mr. James Patten Barber; as vice-presidents, Messrs. David Butler, Nicholas James West and Maurice Wilson; as ordinary members of Council, Messrs. Joseph Bernays, George Austin Pryce Cuxson, George Abraham Goodwin, William

Henry Holtum, Richard St. George Moore, Henry Sherley-Price, Joseph William Wilson, and Edward John Silcock; as hon. secretary and treasurer, Mr. George Burt; as hon. auditor, Mr. Samuel Wood, F.C.A.

During the scrutiny the President addressed the meeting, bringing before the members the salient points of the work of the past year. He referred to and commented upon the papers which had been read, and announced that the following premiums had been awarded by the Council for papers read during the past session, viz.:—The President's Gold Medal to Mr. Thomas Andrews, F.R.S., for his paper on "The Effect of Segregation on the Strength of Steel Rails;" the Bessemer premium of books to Mr. Augustus R. Galbraith for his paper on "The Hennebique System of Ferro-Concrete Construction;" a Society's premium of books to Mr. Benjamin H. Thwaite for his paper on "British v. American Patent Law Practice and Engineering Invention;" and a Society's premium of books to Mr. Brierley D. Healey for his paper on "Recent Blast Furnace Practice."

The President also alluded to the visits which had been made to works of professional interest during the year. These were:—On June 11, to the pumping stations and works connected with the water system of the Crystal Palace and the new roof over the centre transept. On July 16, to the works of the new docks at Southampton, in course of construction, and to the Southampton waterworks, and on September 24 to the works of Jos. Baker & Sons, Ltd., manufacturers of industrial machinery and appliances, and to the machine works of the Wicks rotary type-casting company, both of which are situate at Willesden Junction.

A vote of thanks was accorded to the scrutineers, and the proceedings terminated by a vote of thanks to the President, Council and officers for 1902, which was duly acknowledged.

After the meeting a reception was held by the President and Mrs. Percy Griffith, followed by a social reunion, at which an excellent programme of vocal and instrumental music was carried out under the direction of Miss Gertrude Kemp. During the evening an interesting lecture illustrated by lantern views was given in the lecture hall by Mr. Frederick Lambert, F.R.G.S., entitled "The Crystal Caves of New South Wales, Stalactite Marvels of the Subterranean World." There was a large attendance of members and visitors, and the function, which was the first of the kind held by this Society for many years, was highly successful in every respect.

### TESSERÆ.

#### Jacob Moor and Roman Gardens.

THE Scottish landscapist, who was influential with Prince Borghese, was born in Edinburgh in 1740. He studied art with Runciman. About 1773 he went to Rome. The Prince Borghese became one of his patrons, and under Moor's direction determined to remodel the ground adjoining his incomparable villa on the Pincian hill. The gardens of the Medici and Albani villas, and those called Boboli, near the Grand Duke's palace at Florence, are laid out in a stiff taste, with walls of evergreens, straight alleys, marble fountains and crowds of statues. This style, then obsolete in England, is best adapted to Italy, where a constant and strong sun would soon destroy velvet laws, and the broad shade in a street of clipped trees or covert walks is more coincident with the idea of local luxury. There perfectly harmonising landscapes are found only in imagination and on canvas, for the art of reducing a district of country to the rules of picturesque beauty practised in England is unknown. Moor gave the first specimen of an English garden to the Roman artists, as described in Mason's elegant didactic poem so denominated. The alleys and terraces disappearing, the fountains no longer are forced into the air, and the water, liberated from marble chests, spreads into a lake with irregular shores. Upon a small island in this garden is the temple containing a fine statue of Æsculapius, and another exquisite morceau of architecture sacred to Diana, in an appropriate situation, each of most correct imitation. Other parts of these ornamented fields exhibit the Roman scenes of old. A hippodrome, a villa invariably corresponding with the plan and scale given by Pliny and Vitruvius, and a museum destined to receive the statues found in the city of Gabii, realise the idea of a classic pleasure ground. Moor was not neglectful of his painting. He imitated Claude successfully, and his work was admired by Goethe. He painted his own portrait, in which he represented himself with his coat taken off and lying by him, and as resting under a spreading tree in a forest. He died in Rome in 1793.

#### The "Carved Room," Petworth.

This is a magnificent apartment, 60 feet long, 24 wide and 20 high, and derives its name from its being profusely adorned with the carvings of Grinling Gibbons. The room is probably unmatched for its carved work in the world, and no one who

has not seen it can form a conception of the exuberant fancy and exquisite skill of that prince of woodcarvers; and once seen, it can never be forgotten. Festoons of flowers, fruits, shells, birds, foliage in every variety and play of line, with vases graceful as Grecian artists ever moulded, are suspended from the walls and ceilings in endless combinations. There is a painful interest attached to one of the finest of these festoons, inasmuch as Gibbons's favourite pupil, Selden, lost his life in rescuing it from a fire which occurred here while the work was in progress. The fertility of Gibbons's fancy is amazing. Gilpin lamented that Gibbons was not born in an age of Gothic architecture; and all who look on his works will feel that his marvellous wildness of invention could only in such an age have had full scope. It must be admitted that his luxuriant foliage and endless diversities of form appear a little incongruous within the stiff walls of a classic room. Other rooms at Petworth are also adorned with his carvings; and altogether the collection of them far surpasses any other in England. We ought to mention that another artist was afterwards occupied in fitting up every portion unoccupied with the works of Gibbons, that is suitable to be so adorned, with carvings; and his productions are very beautiful and admirably executed, though they do not approach those of Gibbons in originality or fertility of invention or richness of fancy.

#### Deceptions in Mediæval Castles.

The devices employed in the construction of castles in order to deceive and mislead an enemy are worthy of notice. There are arches and portals to be seen which have the appearance of being ancient entrances filled up; but that such were merely to deceive may be known by finding their exact relative situation with the interior, when it will be seen that these false entrances were not only against the solid side walls, but were frequently placed against the end of an outside wall, or against the end of a transverse division wall, so that these seemingly weak parts were, in fact, the strongest parts of the structure, and any attempt at making a breach through them would be labour in vain. There were also small towers placed in one or two situations which had the appearance of being erected to strengthen weak parts of the building, and these towers themselves had the appearance from without of being weak, from the notion that they contained apartments (which supposition was strengthened by their having loopholes), and therefore easy parts to be battered down. But that these erections were merely to deceive is evident, because they were not only placed at the strongest parts of the building, but they consisted of one solid mass from the bottom to the top, with the exception of a small but strong arch on each floor above the ground floor which led to the loopholes, and their walls were frequently 20 or 30 feet in thickness. The small tower, also, which contains the vestibule was most substantially built, notwithstanding its affected appearance of weakness. The foundations were exceedingly massive and strong, and although weapons might be thrown in at the windows of the vestibule they could do no great injury to this side of the principal tower. Even in the event of the smaller tower being battered down, which would have been by no means an easy task to accomplish, this side of the main tower presented a more substantial front to the enemy than any of the other sides from the absence of openings on the first floor.

#### Buddhism and Indian Architecture.

According to Fergusson there are no monumental traces whatever of the earliest known inhabitants of India, the Tamul race, that still occupies the southern part of the peninsula and forms the substratum throughout of the various existing populations. They were either not a building people, or the materials they used were of so perishable a nature that there are no remains of their architecture. Nor were the tribes of the so-called Indo-Germanic stock, which descended into the Indian plains from the West at a very remote age, originally a building race. The architectural history of India only commences when Buddhism finally triumphed over the old Brahminical faith and became the state religion. This took place in the reign of Asoka, the grandson of Chandragupta, the Sandrocottus of the Greeks, or about 250 B.C. "Not one building nor one sculptured stone has yet been found in the length and breadth of the land which can be proved to date before his accession—an important fact, because at this time the Græco-Bactrian kingdom was still flourishing, and, as we know from coins and other remains, some forms of Greek art, however corrupt, were still preserved and their influence felt in Central Asia to the borders of Hindostan." How far was Indian art, especially architecture, affected by this Greek spirit? The materials are still wanting, and perhaps may never be obtained, to furnish a satisfactory answer, but there is sufficient evidence to prove that that influence had penetrated into India. The oldest monuments hitherto discovered are the Lâts or monolithic pillars, set up, according to the inscriptions upon them, by Asoka himself. One of the best known is that now standing in the fort of Allahabad. Its capital is wanting,

but on the shaft is an ornamental band, so entirely identical with the Greek form of the Assyrian honeysuckle ornament, that its origin cannot for one moment be doubted. A Lât on the Gunduk still preserves its capital, which is purely Persepolitan, thus showing a double artistic influence from Greece and Persia, such as might have been anticipated from geographical considerations. Many of the circular domical topes raised over Buddhist relics may be assigned to the same period as the Lâts. None are of earlier date, most of them are much more recent. They are generally without any well-defined architectural forms and ornaments. Some between the Indus and the Jelum have been found to contain Greek and even Roman coins, and one to the west of the Indus, near Peshawur, is distinguished by barbarous Corinthian pilasters. All these facts point to a connection between West and the East which must have influenced the arts of the country beyond the Indus.

#### Da Vinci and the Venetian School.

According to what is related by Vasari, it was from seeing some works of Da Vinci that Giorgione adopted that mellow, forcible, deep-toned manner of colouring from which he himself, and afterwards Titian and the whole Venetian school derived so much glory. Many particulars which might, if necessary, have corroborated this fact were, no doubt, easily traceable in the time of Vasari. The native writers of the history of Venetian art have sedulously and ungratefully avoided any mention of their obligation to Leonardo. The pictures of Giorgione being mostly painted for private people, are at present, unfortunately, no less difficult to be found than those of the latter time of Da Vinci. There is at Venice but one undoubted, undisputed picture of Giorgione in oil. This picture, which is at the Scuola de' Sartori, is very well preserved; it is composed of half figures of the Madonna and Bambino, San Joseph, Santa Barbara, &c. It is in many parts ill drawn, and from the subject and disposition of it affords but little opportunity for those peculiar excellences which distinguished Giorgione. But notwithstanding, there is enough to account for the very extraordinary admiration in which he was held. The warm, tender glow which is diffused over his carnations, the breadth, force and transparency of his shadows—their happy accord with each other and with the lights and middle tints—and the majestic dusky hues of his secondary lights are, indeed, of the most exquisite relish, and had left nothing further to be wished for but the extension of the same intelligent, happy conduct to the larger and more interesting compositions which soon followed in the works of his disciples and imitators. The few pictures which remain of Fra Sebastiano at Venice are, for rilievo, richness, depth and majesty of hue very Giorgionesque, but it is in the most valued and precious works of Titian that we find this style at the highest.

#### Architectural Effect.

Effect in architecture may be considered under a certain abstract, but at the same time material, sense, as an assemblage of projections and hollow spaces, or smooth and rugged surfaces, which contain materials for more than one kind of contrast, and consequently include combinations capable of producing more than one species of effect. Contrasts of light and shade spring from these varied combinations and aid in producing effect, and it is certain that a uniform mass of even surfaces without hollow or projection could produce no other impression than that of monotony, which is the same thing as want of effect. A mass presenting one smooth unvaried surface, however imposing it may be from its size, is incapable of producing more than one kind of idea in the mind; and thus, after the first general impression has been given, the sight of it, exciting only repetitions of the same idea, becomes wearisome from its monotony. The Egyptian pyramids are grand from their size, but nothing can be imagined more wearisome than for an architect to be condemned to view a pyramid constantly from one point of view. No new ideas would arise in his mind, and no new combinations of forms would suggest themselves, and he might as profitably, in an architectural point of view, gaze on the barren sands of the desert, or the calm surface of the Dead Sea. Very different would be the mental position of the same individual living opposite to the façade of the Louvre, the colonnade of St. Peter's, or the peristyle of the Pantheon. He could every day receive new impressions, and could with difficulty exhaust the store of combinations to which the effect of these works would give rise. The effect that depends on composition is that which results from the varied use of what are called hollows and projections in an edifice. These must, of course, be in a great measure regulated by the variety and harmonious combinations of the lines of the plan, but it is the masses forming the elevation that produce the effect, and which, by multiplying the points of sight, multiply also the impressions transmitted from the eye to the mind, and thus give rise to new combinations of ideas. It is by this variety of aspect that an edifice becomes a sort of theatre, the scenes of which appear to change, either according to the different points of

sight from which it is contemplated, or to the varied disposition of the light which falls differently upon the various hollows and projections of the edifice at different periods of the day.

#### Da Vinci's Manuscripts.

The history of the dispersion of the drawings and manuscripts of Leonardo da Vinci has been narrated by Mazenta. Leonardo, dying at the château of St. Cloux, at Amboise, bequeathed them to his favourite pupil, Francesco Melzo, evidently with the desire that his writings should be edited and published. Melzo seems to have commenced the task by the compilation from the various books of the "Trattato della Pittura," but he did not publish it. Indeed, it remained in manuscript till Poussin, seeing its value, designed illustrations for it, and persuaded Raphael Trichet du Fresne to give it to the world, which was done in 1651. Needless to say, there have been many editions in various languages since that time. The most valuable has hitherto been an edition printed at Rome, from a manuscript in the library of the Vatican, in the year 1817, and edited by the Abbate Manzi. Several years ago there was published a fresh edition of the Vatican codex, edited by Herr Ludwig. It forms the last three volumes of Professor Von Edelberg's "Quellenschriften für Kunstgeschichte." A valuable contribution to the literature of the subject is "Das Malerbuch des Leonardo da Vinci," by Dr. Max Jordan, director of the Berlin National Gallery. To return to Melzo, whom Vasari styles a handsome and amiable old man. He outlived his master probably half a century, but seems to have been sadly remiss in fulfilling his duties as literary executor; neither did he take proper steps to maintain intact his precious legacy after his own decease. The manuscripts and drawings were then held to be of extraordinary value; the cupidity of collectors was excited, and very shortly their dispersion commenced. Then for more than two centuries they were regarded as objects of rarity, and eagerly sought after by *virtuosi*; Arconati was offered more than 2,000*l* by Charles I. for some volumes in his possession. To master their contents, however, was the last thing thought of, precisely as many a modern bibliophile never reads a page of his *incunabula*. The painter Louis Antoine David was the first person who seems to have seriously set about the study of Leonardo's writings. He relates how he esteemed himself fortunate if, after four hours' study, he was able to decipher a page of the manuscript. His labours, however, did not result in publication, and it was not till 1797 that any really valuable account of Leonardo's scientific studies appeared in print. It is to J. B. Venturi, an Italian professor, settled at Paris, we are indebted for the first insight into these hitherto unexplored documents. The title of Venturi's work is "Essai sur les ouvrages physico-mathématiques de Léonard de Vinci, avec des fragmens tirés de ses manuscrits apportés de l'Italie, &c. Paris, 1797." It still remains one of the most useful aids to the study of Leonardo. Being now very scarce a reprint would be a boon for which students would be grateful. Since Venturi's essay there has been a continuous series of works illustrating various phases of Leonardo's activity, of which Amoretti's "Memorie Storiche" and Bossi's "Cenacolo" may be cited with approval. To enumerate the various lives, monographs and treatises would take up considerable space, for the literature of Leonardo fills a goodly library shelf.

#### Poussin and Jan Steen.

Culture, though it cannot supply the place of genius, will arm the possessor with something which will at all events prove a satisfactory practical substitute for it. Two instances can be selected from the history of painting. The name of Nicholas Poussin stands high in the estimation of the world, and his pictures are found in every public gallery in Europe. Now had he not possessed his marvellous culture and as its result his philosophical breadth of mind, it is a great question whether the purely artistic gifts with which he was endowed by nature would have sufficed to make his name known at all. It is also probable that had he chosen to express himself with the pen instead of the brush his imagination, his knowledge and research would have enabled him to delight men's minds with a lively representation of the whole atmosphere of thought in which the ancients lived, and of the imagery which moulded and adorned their speech. On the other hand, if Jan Steen had devoted himself to literature instead of to painting we cannot imagine him, though his was evidently a powerful mind, to have enriched the world with anything more valuable than a tavern song, and it would have been incomparably the poorer for the loss of his pictures. He was great by force of his genius only, the other was great by force of his culture in default of genius.

The Government Factory at Sèvres will reproduce several statuettes from models by the late Jules Dalou. The profits will be applied to the "Orphelinat des Arts."

## NOTES AND COMMENTS.

WHEN commenting in our number of March 14 on the case *BICKMORE v. DIMMER*, in which it was claimed that the erection of a large clock, 4 feet diameter, outside premises in Liverpool, was an alteration, and in consequence a mandatory injunction for its removal was sought, we ventured to express our dissent from Mr. Justice FARWELL'S decision. His lordship held that there had been a breach of the covenant not to make any alteration to the premises without the lessor's consent, and he granted the mandatory injunction. The defendant appealed. We then said:—"To the majority of people it will appear an advantage for lessors to have similar alterations made without cost to them, for if the premises had gained a reputation for clocks and watches the big clock would be enduring evidence that the business was carried on, although the premises had fallen into the hands of a different lessee." The appeal was heard on the 4th inst. The lease had a clause to the effect that the lessee would not make or suffer to be made any alteration to the premises except as therein expressly provided without the previous consent in writing of the lessors. Lord Justice VAUGHAN WILLIAMS said it would be impossible to hold that every addition to the premises was within the meaning of the covenant. In such a case a tenant would not be able to put up an exterior blind, a lamp, or a knocker. His lordship thought that the words "alteration to the demised premises" could only be applicable to alterations affecting the form or structure of the building. Lord Justice STIRLING considered the clock to be a reasonable and proper mode of announcing the business carried on. Lord Justice COZENS HARDY held that there must be some alteration to the words. It might be supposed that the papering of a room, or the introduction of a gas bracket or electric bells, was impossible. The clock could not be claimed to affect the form or structure of the building. The appeal was therefore allowed. As a rule, actions are taken for the removal of fixtures. In this instance an attempt was made to prevent the addition of a valuable fixture. It should be remembered that the lessee holds a lease of which about nineteen years are unexpired, and if he succeeded as a watchmaker and jeweller the lessors would afterwards reap an advantage from the clock, which would have become an established sign. And here it may be noted that while in England the clock or any similar announcement would become the property of the landlord, in France any sign or announcement such as the clock remains the property of the tenant who fixed it, and he can remove it with him in order that no succeeding tenant can obtain any benefit from it to the other's disadvantage.

MANY efforts have been made to deal with the onerous problem of housing the poor of Glasgow. Much has been done, but it cannot be said that a solution has been obtained. The subject is being investigated by a municipal commission consisting of sixteen members, nine of whom belong to the Corporation and the rest ordinary citizens. The evidence of the first witness, Mr. HENRY, the city assessor, suggests the magnitude of the problem. In Scotland, it is well to remember, a house may be one of very numerous rooms in a building, and according to the assessor the unoccupied houses at 6% and under had decreased 51 per cent. during the past eleven years, while for the same period the unoccupied houses at rents above 6% and under 10% had increased 75 per cent., and the unoccupied houses at 10% to 15% inclusive had increased 404 per cent. The population of the city in 1891 was 656,185, compared with 776,967 in 1902. In 1891 there were 33,446 houses of one apartment, against 36,422 in 1902; 59,768 of two apartments, against 72,099; and of three apartments 22,611, compared with 27,695; and of four apartments and upwards 19,057, against 24,630. At first sight the figures might be taken as evidence of sanitary improvement. A single room is insufficient in cases where there is a family, and it might easily be concluded that sacrifices were made in order to possess two or more rooms. Unfortunately there are still people who cannot afford to rent more than

one room, and they are increasing to a larger extent than the single-room dwellings. The Corporation of Glasgow have erected houses of a single apartment, but from a division introduced in each of them they become practically two-roomed houses. Private proprietors no longer desire to invest their money in building houses that can be let at 5% a year. As there is little increase in number, the rents of single-roomed houses have advanced 14 per cent. during the last eleven years, while with two-roomed houses the rise was 6½ per cent. The tenants who are satisfied with a single room are not always desirable. The only remedy Mr. HENRY could suggest was for the Corporation to utilise available ground within or without the city to provide accommodation, and if the dwellings were outside the city then the tenants should have free passes to travel by tramway cars, or in the rent an allowance for fares should be included.

THE late JOHN HUNGERFORD POLLEN, who died at Bayswater on the 2nd inst., was so long associated with South Kensington it was excusable to imagine that he was an ordinary official who had passed through many grades until he became editor of the Museum Handbooks, and author of some of them. But prior to becoming one of HENRY COLE'S lieutenants he led a life not without interest. The son of a baronet and born in 1820, he studied in Oxford and was elected a Fellow of Merton. In course of time he was appointed bursar of his college, and was Senior Proctor. He possessed skill as an amateur and decorated the college chapel. It is also said that he co-operated in the paintings for the Union. Being a clergyman he became vicar of St. Saviour's, Leeds. Faithful to his convictions he left the Church of England, and when Dr. NEWMAN was appointed head of the Catholic University in Ireland and was allowed to organise a staff of professors, Mr. POLLEN was made Lecturer on Art. It was the first time such an office was created in an academical institution in this country. His knowledge was tested in a remarkable way. There was a lecturer on architecture, but he was supposed to have been faithful to the Gothic style. Dr. NEWMAN wished to have a University chapel erected at his own expense; he was therefore justified in preferring a style which seemed to him to be symbolic, and he selected the Basilican. The building was carried out for him under Mr. POLLEN'S direction. There were divisions which were believed to correspond with those in the early churches, and to be used by people not fully initiated into the doctrines of Christianity; but no such use of them was made in Dublin. One of the peculiarities of the building was the extent to which the coloured marbles of Ireland were utilised in large slabs to line the walls. The upper part was hung with copies of the tapestries in the Vatican for which RAPHAEL prepared designs. There was gilded latticework in the galleries, and the interior thus produced colour effects unusual in churches in the fifties. In the *Atlantis*, which was the official magazine of the University, Mr. POLLEN gave an account of the basilica. The withdrawal of Dr. NEWMAN from Dublin was followed by Mr. POLLEN'S resignation. Subsequently he accepted an appointment at South Kensington, and there his wide knowledge was turned to account with much advantage to the administration.

## THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. L. Ambler, vice-president, in the chair.

The following were elected as members:—Messrs. L. J. Prestwich, E. N. Trounson, K. Gammell, G. Seward Turner, T. S. Inglis, G. T. Hine, F. W. Pomeroy, T. Raffles Davison and J. S. Gibson.

Messrs L. Solomon and Herbert Hooper were reinstated members.

Mr. J. S. GIBSON read the following paper on

## Architectural Practice, Real and Ideal.

He said:—This subject does not need any introduction to this audience; it is perhaps too closely connected with us all to be appreciated at its proper value. The things of our everyday life are apt to get a little out of perspective, and an attempt to put them into their real relation to the other parts of our environment may be of some use.

Architectural practice of some sort is always with us, and as a rule we take it as a matter of course, like the rising of the sun, and hardly question its rightness or wrongness, its fitness or unfitness for our time. In so far as we think on any important subjects, we are influenced by two impulses, one to accept things as we find them, and the other to inquire into them and discover if possible the reason of their being.

A healthy curiosity into the abstract question of architectural practice is a desirable thing, but I am afraid few would so consider it if applied to the mysteries of any individual practice; so in this brief essay on the subject we will try not to offend any honest fellow-architect.

It has always appeared to me as very peculiar that the pupil who passes three years in his master's office and, say, another five or six years as assistant, should rarely hear a word on the all-important matter of how to begin and carry on the practice of his profession. Considerable time and labour on the part of the master are often devoted to make him an efficient draughtsman, to give him a workmanlike grasp of construction, to instil within him a knowledge of the simpler methods of planning, and to awaken an appreciation of the great achievements in design, while no attention is given to the more intimate relations between parties, common to all practices. Some men I know have been exceedingly kind to their former assistants, and have greatly helped them with advice when they have had to deal with a difficult question, but this is usually after they have commenced practice on their own account; but, for the life of me, I cannot see why the experience necessary to deal with many of these difficulties should not be gained in their master's office. There are a thousand and one questions involved in our relations with contractors, public bodies, fellow architects and clients that might very profitably be discussed in the presence of our assistants, and in which they might take part.

Let us now give a few moments to the consideration of the time antecedent to practice, the pupil and assistantship period, if I may so designate it. This must be a period of enthusiasm for the work, the glamour and poetry that the spirit of youth alone can impart must be pre-eminent. Compared with the sculptor or the painter you must have more enthusiasm, for their handiwork is the realisation of their ideals, while yours has to be carried out by other hands before it can be judged or appreciated, and at this early stage the chance of this being done is still remote.

The architect's early training is also a much more arduous and complicated one, and I do not think we can reasonably expect to do with less than six or eight years of really hard and earnest labour; but at the end of that period we ought to have such a grasp of our work as will enable us to deal successfully with the problems given us to solve. During the second half of this initial stage a considerable amount of measured work from good examples, irrespective of styles, should be done, together with sketches which get as near as possible to the heart of the design and leave the art of merely pretty drawing severely alone. A good motto for this period might be "Draw often and accurately." The mind should be in a receptive condition, so that each new experience should find soil in which to take root and room to grow.

The world has grown so tiny now that visits to the various architectural centres of Europe may be easily accomplished at this period and the beneficial effects of the study of the old masterpieces of architecture is invaluable. We have now arrived at the stage at which the man has spent energy, time and money in acquiring the facility to plan and design, his mind directed into the right channels likely to lead to the development of his most cherished art, and he is confronted with the necessity of using this experience as a means of earning his livelihood. By what methods can he make his capacities known to those desirous of building? In countries where the mass of the people know something of art and value its beneficial effect on everyday life—say in France—it is considered a part of the Government's duties to see that the most

meritorious and gifted students are rewarded by commissions to paint pictures, design buildings and execute sculptures on all occasions when public works of this kind are required; and I am glad to think they are often required in such countries. But we manage things differently on this side of the Channel; our Governments think their duty accomplished by making one of their partisans First Commissioner of Works, and this estimable gentleman usually dances to the tune piped by the permanent officials, whose sympathy with, and knowledge of, the arts are painfully evident by their works scattered throughout this long-suffering country. There are times—intermittent, it is true—when the political mind doubts the omniscience of the official mind, and the political mind boldly resolves to go outside the Government offices for the design of some important building. Until a few years ago it was the custom to throw these matters open to all competitors, and, as a rule, the result justified the action. But of late years these competitions have been restricted to the men whose experience extends over a considerable number of years, and so this avenue is now practically closed to the young architect. From the Government, then, the beginner need not look for any help to establish himself in practice. A man's personal friends, in the majority of cases, may perhaps be the means of giving him the first few chances that go to prove the stuff he is made of, and if there is any real good in his work it will bring more in its train. It is during this early period that many men compete for work of all kinds, and by so doing gain an experience in planning and design that is worth the labour and time expended, although they may bring no other reward. When we think of the fearful and wonderful arrangements in the planning of public buildings, and the more fearful architectural embellishments of these plans which were the painful results of early efforts, we cannot be too thankful that these things never got beyond the paper stage, and that an unappreciative assessor passed them by and thus saved us from having to live down an early indiscretion.

Competitions are not unmixed blessings to the profession, but we must admit that the buildings erected under this method compare favourably as a whole with the average of works erected without competition. I should certainly advise all men, for the first few years of their practice, to take part in well-conducted competitions, but be sure the conditions are fair, the assessor competent, and the subject one they know something about. And as soon as the state of their practice warrants it, I should also advise them to let competitions alone. There are many amusing and curious ways of obtaining a practice, and for all of us it is a serious question to determine how to start on our career. But it has to be settled at an early stage, or else it will effectually settle us. Some cut the Gordian knot by leaving the ranks and embarking into the maelstrom of "trade;" these are the wise but inartistic ones. Some rely on the artistic blindness of the general public, and run lucrative drawing manufactories on business-like lines. These are the shrewd and "practical" ones. Some have relatives who are something big in the City of Finance or Society, and these push their architectural appendages in the same manner as they do shares, or officers in the army. What Lord Melbourne said about the bestowal of the Order of the Garter, that "There's no damned merit about it," we may safely say in reference to the practice of these fortunate ones. Some drift into that refuge of mediocrity, an official appointment in a Government office, and in the Office of Works, or such-like departments, do what they can to spread the commonplace over the land; these can hardly be said to practise, either really or ideally. Some enter into competitions, throwing all their energies and skill therein, in the hope that merit will be rewarded. These are the sanguine ones, and sometimes they are not disappointed. Some enter into partnerships with clever men of business, who "manage" the clients while they manage the office. These are the timid ones—likeable fellows who think the chief end of life is to get a cornice perfectly proportioned or a skirting-board properly moulded. Some attach themselves to the land and, backed by financiers, erect enormous piles of vulgarly commonplace type, whose chief quality is bulk, and whose erection in some slight degree justifies the short leasehold system of land tenure. These are the wily ones. Some develop an absorbing interest in rights of light and devote precious time to the intricacies of party structures, and then pass away full of years and riches. These are the canny ones. Some renounce art and become crafty, finding that the public will pay more willingly for the abnormal than the artistic. These denounce style, balance, composition, rhythm, grace, and are sharp-sighted leaders of the blind. Some determine to live for art's sake, and usually die for it instead. These are the foolish and artistic ones. These are but a few of the thousand and one ways of practising our profession, and each of you must one day settle this great question for yourself.

Turning to the realities of practice, one may say, "Happy is the man who knows nothing of them;" for the whims and vagaries of the client are sometimes as difficult to deal with as

the prejudices of the architect. Among the first troubles to assail you are the reconciliation of the wants of the client with the amount of money he is willing to spend. In this matter it is well to show as kindly as possible the impracticability of expecting 5,000% worth of accommodation for 3,000% cash. Never estimate your buildings too low; it will prove easier to have a margin to meet the changing views of your client rather than a deficit to ask him to wipe off. Having satisfactorily settled the money question you can, with a merry heart, set about the designing of your house, and if your client expresses a strong preference for any unusual disposition of rooms you must give this your best consideration, for after all he is the person who is to live in them. If you have hit on any particularly good arrangement do not throw it at the good man, but lead him gently to it and thereby gain his approval, for this is more often won by strategy than by force. Always be ready with examples of similar cases, and if these are already known to your client so much the better, for then he feels on safer ground; all clients prefer experience to experiment.

When discussing any question never imagine that force of language will atone for lack of reason. You will often find your client expressing his views on the architectural styles, and if he desires you to design him a house which shall be Palladian Renaissance outside and English Gothic inside, do not regard him so much as a lunatic as one who requires careful treatment, as his appetite for styles may be omnivorous. Having matured your design and written your specification, do not think that your worries are ended. Under the present system of competitive tendering for work you may find yourself face to face with a builder who solemnly assures you that Smith's blue lias lime is much stronger and better than Brown's Portland cement, that drain pipes are best jointed with clay, and that footings should rest on the solid earth without the intervention of any concrete under them. Should you meet such a man, no doubt you will inform him of your good old crusted prejudices, and stick to the specification. Having taken a firm stand in your dealings with a builder of this kind, maintain this attitude to the end, and you will generally succeed in getting a creditable job for your client, although at some trouble to yourself. But we must not forget that we are paid for the trouble involved in getting our buildings properly erected, as well as for designing them.

One of the surprises of practices in their early stages is the extraordinarily easy manner in which variations can be made on contracts during execution, so that when the accounts come in they often surprise the architect more than any other person. The apparently innocent suggestion to "omit the moulded beam and side brackets" over an opening, and just "put in a couple of semicircular arches with a column and two pilasters," has, in some mysterious way, been expanded into about five pages of a bill of extras, the total of which makes the architect gasp. The one safe rule in all these matters is to make a drawing and get a price fixed before any work is done. If, however, you have made the variation without a price being previously fixed, you may rely upon one friend in your extremity, the quantity surveyor. He is the man who can pull you through. How he does it I do not pretend to know: perhaps he has no bowels of compassion as far as builders are concerned; perhaps there is some freemasonry of which you and I are ignorant, but, at any rate, he will usually succeed in making a bill more palatable to your client and yourself, and we cannot be too grateful to him for these services.

In your dealings with your client, as with your builder, make up your mind on the matter in hand, and never depart from your determination. Do not be so foolish as to expect to get your own way always; you will be a lucky man if you get it occasionally, but if you show signs of indecision of character, depend upon it you will never get it at all. Should your client upon any vital matter prefer his way to yours, let him clearly know that the responsibility for success or failure rests on him.

If your work be at a distance, and frequent visits are impracticable, do not be surprised at the variations the builder will quite innocently make on your designs. Some of the most charming results are often thus accidentally obtained. Years ago a fellow-architect said to me, "It's a poor design that does not admit of improvement in execution," and the ripening experience of the translation of drawings into solids will suggest the variations that are improvements. Do not worry too much about the finish of your drawings. The work itself is the heart of the matter, and above all things, do not over-elaborate the details of your buildings. A multiplicity of detail does not insure a fineness of quality, and I had rather see one good architrave round every door of a house than an abundant variety of commonplace sections. You may dash off sketches of façades and interiors; many of the happiest inspirations are the most evanescent, but as you grow older you will find it harder to let your full sizes go out of the office. These are the final stages in your part of the work, and by them you will be, in a great measure, judged.

The requirements of modern civilisation are so varied and complex, and we live at such a rapid pace, that even the prac-

tice of architecture has been invaded by "specialists" who apparently imagine that a thorough knowledge of technical details will compensate for a lack of knowledge of the art of their profession. There is hardly any modern pretender so lacking in justification by his works as the architectural expert or specialist. It may be argued that this is the only scientific method of dealing with modern complicated requirements; if so, its scientific efficiency hardly justifies its artistic barrenness. My earnest advice to you is to make your practice cover as wide a field as possible; shun specialism, however lucrative it may appear.

Within the scope of a moderate practice you will find extensive demands made upon your knowledge. Apart from the capacity to design, there must be the ability to design within the limits imposed by the requirements of the Building Acts of London, provincial and urban authorities, to utilise in the best way the properties of steel, iron and concrete, as well as the older building materials, stone, brick and wood. You must also be conversant with the latest patents in pavement lights, have a knowledge of the virtues of glass tiling, know the strong features of burglar-proof sash fasteners, and give a warranty that your door-knobs will never come off the spindle. Besides this all-embracing knowledge that is required of us, a new danger is rising up, born of our advancing civilisation. We are now in the glorious days of trusts and combines, when everything is on a colossal scale, especially the capitalisation, and no doubt the inherent poverty of our profession is the only thing that thus far has saved us. Think of the waste of energy going on in the artistic world to-day, of painters and sculptors creating pictures and statues and trying to find a market for them—often in vain. Imagine the immense saving that could be effected by a Pierpont Morgan buying up the output of Sargeant, Whistler, Shannon, Swan, Guthrie, Lavery, Brock, Gilbert, Frampton, and putting these artists on regular employment at a fixed wage, under healthy conditions in a factory complying with all the requirements of the Factories Act, whatever these may be. Saved from the rapacities of the "dealer," in Bond Street and out of it, what magnificent works these men would turn out, while the public would no longer have to go to the dealers to be advised as to the safest thing in which they might invest their money, as if works of art were mining shares and dealt in for the rise or fall of an active market. The only bar to the success of such a scheme comes, strangely enough, from the artists themselves.

I have talked so long on some of the realities that little time is now left in which to speak of the ideal practice. It is like the promised land—before our eyes, but never beneath our feet. Of what would such a practice consist? we ask, and everyone's temperament will dictate a different answer.

The ideal practice must surely be that which insures the evolution of the individual in the advancement of his art. To progress along parallel lines with your art must be a desirable thing, though it can hardly be said that, as a rule, our practice affords many facilities of this kind. Some requirements necessary to this end are common to many of us; these can be summarised as follows:—Work which is congenial to our temperament, and in which a healthy interest may be taken. Time to think out our problems as a whole and evolve slowly their detail. Absence of all "rush and worry." An appreciation of the good points in our designs by those for whom the work is done. A few assistants, good men and true, who will carry the knowledge gained a step further on their own account. I could guess the young practitioner's ideal to be, that his buildings would turn out as fine as his conception of them, but the hard facts of reality destroy the charm of these imaginings. I could guess the middle-aged practitioner's ideal to be, to begin again, with all the vigour and enthusiasm of youth, coupled with the matured experience of his years, but this combination is impossible of realisation. I could guess the old man's ideal to be, to be spared to practice for a few years that great art to the threshold of which many years of travel has brought him, but the inexorable summons comes, he steps across another threshold and the door closes behind him for ever.

As far as the necessities of living will permit us, I think we should do all we can to realise our ideal practice, to advance the science and art of our calling, to do justice to our clients, our builders and ourselves, and to uphold the honour and dignity of our profession.

Mr. COLE A. ADAMS, in proposing a vote of thanks to the author, said he could hardly add any information to the excellent paper they had heard read. Reference had been made to the need of giving pupils and assistants in architects' offices hints and suggestions. The speaker thought that the more this rule was spread abroad the better for the profession. It often happened that after spending many years as assistant in an office the young architect when starting on his own account had little idea of how to manage his business. He, the speaker, had always adopted the rule in his office, and encouraged his pupils to discuss any point that might arise in their work.

Mr. A. O. COLLARD, who seconded the motion, said there

was no doubt that the harder pupils and assistants worked on problems raised in the office, the better would be their knowledge of architecture afterwards. For successfully dealing with clients he thought architects might cultivate the manner known among doctors as the bedside manner. Such sympathy seemed essential to a doctor's practice, and architects might imitate them. Architects were rather apt to think of practicable methods and practical people like builders, and they forgot that other clients might require some different treatment. The experience of successful architects seemed to point to the necessity of getting one's own way with clients, and therefore it would be hazardous to adopt any but a persuasive manner.

Mr E. GREENOP, in supporting the vote, said from his point of view the real and the ideal practice would be similar. The real was full of difficulties, and the ideal should be the same.

Mr. C. H. BRODIE said the profession was to blame for the lack of experience so often shown by young architects in their dealings with clients. There was no reason why the pupil should not be present at the consultations which took place in the office and on the job. If architects would give up the attitude of suspicion they so often adopted towards their assistants the profession would benefit. He also wished to see abolished the custom of sometimes inserting a clause in a pupil's articles which prohibited him, after having served his time, practising within a fixed radius of his master's office. Referring to engineers and bridgework, the speaker said they were forced to ask themselves why individuals and governing bodies placed more reliance on the engineer than on the architect. He believed it was because the engineer always knew his materials and their limits in construction. It would be well for the young architect of to-day to possess the same knowledge. Let them study their materials, and the amalgamation of the real with the ideal would be an accomplished fact.

The CHAIRMAN, thanking Mr. Gibson for his paper, said it was well for a young architect before beginning on his own account to have been engaged as managing assistant in another architect's office. Such experience was gained as made him more confident in his own powers. The answer to the question of how to conduct a practice depended upon the sort of architect the pupil was engaged to. Many architects made it a rule to discuss points raised in their work before their assistants; such practice was common to the smaller offices. He quite agreed with Mr. Brodie that the pupil should not bind himself by signing articles or indentures when a clause was inserted prohibiting future practice within a certain radius. He could not believe that such clauses were often inserted.

Mr. GIBSON briefly replied. He did not advocate the cultivation of a "bedside" manner in dealing with clients, nor could it be said that all doctors took up such an attitude towards their patients. The "bedside" manner could be carried to excess. He had never seen a clause in any articles prohibiting practice within a certain radius, and he advised any man to positively refuse to sign any such document.

## FACE-SHAFTS OF HEREFORD CATHEDRAL.

THE following article, which appeared in the *Eccelesiologist* for June 1849, while the restoration of Hereford Cathedral was in progress, will suggest the difficulty of dealing with a peculiarity which was a surprise to many archaeologists:—

The restoration of this church still continues with unabated energy. A very strong opinion having prevailed that a portion should be opened as speedily as possible for Divine service, which has been interrupted for seven or eight years, it was resolved by the committee that the nave should be forthwith completed for that purpose with temporary fittings, the committee having funds at their disposal sufficient for that object, though not for the completion of the choir and greater transepts. On the removal of the present floor with the view of restoring the pavement to its original level, it was discovered that the Norman piers, instead of resting on circular bases of small projection, were placed on bold square bases which had been concealed under the modern paving. These, when opened to the original level, gave an unusually fine proportion to the massive Romanesque pier-range of the nave, though the piers, when buried, had presented a depressed and stumpy appearance. Nor was this the only discovery: the small plinths which served as bases to the double semi-cylindrical face shafts, formerly running up the face of the piers, were also brought to light, the original face-shafts having been removed to make way for an incongruous triple vaulting shaft substituted by Wyatt when he erected the meagre triforium with its painfully glaring clerestory after the fall of the great western tower in 1786.

The restoration of the face-shafts, although scrupulously copied from the ancient examples still remaining on the opposite side of the piers (having never been removed by Wyatt)

terminating as they do in small double capitals reaching only to the height of the capitals of the great cylindrical piers, instead of being carried up as vaulting-shafts, has occasioned much discussion not only in the committee, but amongst others who are loud in their condemnation of them as non-supporting capitals—a supposed grievous architectural anomaly. But independently of the extremely diminutive proportion of the capitals and abaci, which, when sculptured, scarcely project beyond the larger capitals of the piers that are bisected by them, it is clear that they formerly existed, a fact sufficient to justify parties engaged in a work of restoration in replacing them. This is not only proved by the buried plinths, but by this identical feature being found at the back of these very piers. What appears a still further justification of the decision of the committee is that the self-same anomaly of their being non-supporting shafts is found existing in a precisely similar manner in the aisles, where the vaulting springs from corbels detached from the capitals of the face-shafts by an interval of several feet, thus proving beyond contradiction that for nearly five centuries, when the Middle-pointed roof was erected, they could not have served the purposes of vaulting-shafts, or have afforded any real support to the groining.

Though it is conceived that the examples in their own cathedral would partly exculpate the committee, yet, as instances are not wanting elsewhere to show that even the soundest theory was sometimes departed from in practice, it may be permitted shortly to refer to some examples in further corroboration of the remark. Thus in the church of St. Ambrogio at Milan similar face-shafts to those at Hereford are to be met with, extending no higher than the base of the triforium, where these capitals lose themselves under a corbel table, which has no more need of such support than a string-course. In the meantime the construction of the fabric plainly shows that they could never at any period, either in appearance or reality, have served the purpose of vaulting-shafts for the support of the roof. Again in the cloisters of the cathedral of St. Trophimus at Arles, a Romanesque building apparently interspersed with fragments of the Roman antiquities with which the neighbourhood abounds, a still more flagrant instance occurs. Here Corinthian pilasters of considerable depth, which have not even an entablature to support, serve the purpose of buttresses. The most complete case in point, however, is to be met with in the magnificent nave of the cathedral at Bayeux, the piers of which, though not exactly similar in other respects, are ornamented with face-shafts terminating in small capitals precisely resembling those which have been so loudly condemned at Hereford; while the vaulting-shafts spring from corbels at the base of the triforium exactly as Mr. Cottingham has proposed. These instances are by no means brought forward as examples for imitation, but to afford additional proof, if such were wanting, that the ancient architects did not scruple occasionally to depart from a minute attention to a theory or principle with which they must have been well acquainted, when either special circumstances rendered it advisable, or the necessities of construction did not require them to be bound by it.

By thus disregarding the chance of censure in preference to a blind adherence to a theory, the committee have been enabled to preserve an extremely rare feature of unusual interest, the occurrence of the double face-shaft not being to be found in any of the pier-ranges of the larger Romanesque buildings in this country. At least it is certain, if the engravings are to be depended upon, that it does not occur at Gloucester, Tewkesbury, Leominster, St. Cross, Malmesbury, Durham, Peterborough, Waltham Abbey, or Christ Church, Oxford; and the effect produced by it, affording as it does shadow and variety, instead of the monotony of a smooth cylindrical mass, needs only to be seen to be appreciated, and to justify the decision which has been arrived at.

The triforium and clerestory, with the vaulting, being of fair and harmonious proportion, will, when cleared of white-wash, notwithstanding some offensive and palpable defects, present an appearance of solemnity and church-like character; and should the vaulting be decorated as proposed, with stencilled diapering of appropriate design (the ribs of the groining, though of wood, being of better character than was common at the period when it was erected), it cannot fail to produce a striking and solemn effect, not only from its being in keeping with the warm tint of the natural stone, but as harmonising with the subdued tone of colour of the black and red Staffordshire tiles (arranged in compartments), with which it has been determined to pave the nave and aisles.

One more circumstance remains to be noticed. It being clearly impracticable to attempt to unite the restored face-shafts of the piers with Wyatt's triple vaulting-shafts, no change will be made in Mr. Cottingham's design, which, before the discovery of the plinths before alluded to, had provided for their removal from the face of the piers, and made them spring from brackets on a level with the string-course of the triforium, an arrangement (now that it has been determined to replace the face-shafts according to the original design), which secures to

the pier-range—the only portion of the nave which is really ancient—a perfect and complete restoration; thus separating by a broader line of demarcation than ever the ancient from the modern work—the work of Lozing or of Rayneim from the work of Wyatt.

### ALLEGED ENCROACHMENT ON THE STRAND.

AT the meeting of the London County Council last week a discussion took place upon a recommendation of the improvements committee that 203<sup>1</sup>/<sub>2</sub> should be paid by the Council to the owners of Carr's Restaurant at the eastern end of the new curved street connected with the Holborn to Strand improvement, in consideration of being relieved from the obligation of constructing new vaults. In their report upon the subject the committee mentioned that the vaults which had been constructed extended beyond the old frontage line and under the existing footway to an extent varying from 6½ inches to 1 foot 8 inches—that was to say, the vaults projected 16 feet beyond the new frontage line of the building instead of 12 feet, as allowed in the case of other vaults along the new street. It had already been arranged to plant trees on the footways, and to enable that to be done in front of Carr's Restaurant (a length of 104 feet) it would now be necessary to alter the position of the subway for pipes. The owner of the restaurant, before constructing the vaults, obtained the sanction of the Westminster City Council, but the committee were advised by the solicitor that, having regard to the special provisions of the Act of 1899, which authorised the improvement, the Council was the only authority having power to sanction the construction and extent of the vaults. The City Council did not, however, accept this contention of the Council, and stated that it failed to see that its action in the matter had been in excess of the statutory authority possessed by it under the Metropolitan Management Act, 1855, or had impinged upon the special powers obtained by the Council. The committee learnt that Mr. Cox (the owner of the premises) had already let a large portion of the new vaults, and, whilst they regretted that the architect (Mr. Emden) acting for Mr. Cox did not, after communicating with the local authority, inform them of his intention to construct the vaults to the line sanctioned by the Westminster City Council, they felt that, having regard to all the circumstances, they could hardly advise the Council to refuse payment until the vaults had been reduced to the 500 superficial feet, as originally agreed with Mr. Emden.

Mr. Benn thought the recommendation hardly strong enough to meet the case, and that Mr. Cox should be asked to restore the land he had occupied beyond the 12 feet. He therefore moved to add to the recommendation the words, "and also requiring Mr. Cox to make proper application, with plan, for the land already taken by him for vaults up to the frontage line of 12 feet and to surrender to the Council the portion of the vaults which is more than 12 feet in advance of the new frontage line and to construct the necessary dividing wall."

Mr. Goodman seconded the amendment.

Mr. Emden narrated the whole circumstances of the case, and denied that he knew that the subsoil at this position was vested in the London County Council or that it was necessary to have the plans sanctioned by the Council.

Mr. Robinson pointed out that there was so much doubt about who was the authority that it was easy to understand how a mistake might have occurred here.

Mr. Sidney Low hoped that, after the explanations, Mr. Benn would see fit to withdraw his amendment. If, however, it was persisted in, it would be very likely to inflict inconvenience on the Council and a great deal of cost on the ratepayers, because the question would not be settled without recourse to a court of law. If the Council's legal position in the matter was, as they were told, unassailable, they should explain how it was that they did not enforce their legal rights. If there was negligence, that negligence was shared in by the Council as well as Mr. Emden.

Colonel Probyn was satisfied that neither Mr. Emden nor Mr. Cox had the slightest idea of taking advantage of the Council. Rather than take the matter to the courts of law, he thought they should submit it to arbitration.

Lord Russell said that it might have been by an honest mistake, but at any rate the Council had had a portion of its new street filched from it without its knowledge. Mistake or not, they could not submit to that without having the matter tested.

Mr. McKinnon Wood suggested that perhaps the best course would be, as there were many issues involved, that the whole subject should be referred to the general purposes committee.

Mr. Benn agreed and withdrew his amendment.

Mr. McKinnon Wood moved that the matter be referred to the general purposes committee.

Mr. Harris seconded the amendment, which was adopted.

### THE IRISH INSTITUTE OF ARCHITECTS.

THE annual meeting of the Royal Institute of Architects of Ireland was held on the 4th inst. Mr. George C. Ashlin occupied the chair, and there were present Messrs. W. J. Gilliland, Charles H. Ashworth, Robert J. Stirling, R. C. Orpen, W. Kaye Parry, Harry Allbery, Thomas A. Coleman, Frederick Hayes, J. Rawson Carroll, C. J. MacCarthy, A. E. Murray, James Webb, C. A. Owen, Joseph Holloway, Fred Shaw, Geo. L. O'Connor, R. O'Brien Smyth, M. G. Hicks, W. W. Mitchell, R. C. Millar, Fred Batchelor, A. G. C. Millar and Sir Thomas Drew.

The President in the course of his address said:—The revision of our recognised form of building contract has now become a pressing question, chiefly in consequence of the communications addressed to us by the Irish Builders' Association, and of the favourable view taken of many of their proposals by the Royal Institute of British Architects and of other bodies representing the profession in England. The present recognised conditions of contract have stood the test of experience for many years fairly well, and have been generally accepted by both parties to the contract. No desire for any radical change has been expressed on the part of the employers. From the nature of the case this could hardly have been expected so far, but as they will naturally look to us to safeguard their interests, it would seem proper to endeavour to ascertain their views by consulting public boards representing employers and by adopting any other means in our power before consenting to any radical change in the present recognised form of contract. There appear to be two such changes proposed, viz. (a) the appointment of an independent arbitrator to adjudicate during the progress of the work on such questions as the meaning of the plans and specification hitherto left to the sole decision of the architect; (b) the taking of the quantities part of the contract. A most laudable desire has lately sprung up amongst our junior members and aspirants in the profession to improve the system of architectural education, with a view of obtaining a distinctive qualification by compulsory examination, as in other professions, and I presume, of paving the way ultimately to the statutory registration of all practising architects. I am sure the senior members sympathise with this desire thoroughly, and would be most willing to aid the movement in any way in their power.

Mr. W. Kaye Parry read the report of the Council for the year, which stated that, though comparatively uneventful, the year had been characterised by steady work. It then referred to the routine business which had been transacted by the body during the year. The statement made in the House of Commons last May by Mr. Austen Chamberlain respecting the proposed College of Science buildings in Upper Merriem Street naturally came as a surprise and disappointment to the profession. Your Council, having considered the matter, passed unanimously the following resolution giving expression to their views on the extraordinary proposal of the Government, viz.:—"That the attention of the Council having been drawn to a statement of Mr. Austen Chamberlain in the House of Commons on May 28, thus reported, 'As to the architect, before the Bill left the House he would give the name of the architect selected. No choice had yet been made, but he had been in communication with the Chief Secretary and the Department of Agriculture, who were entitled to a voice in the matter, and the claims of several architects, both Irish and British, had been considered. Personally, he should be most anxious to have an Irish architect, but, in any case, whatever was done, hon. members might rest assured that the Government should associate an Irish architect with the work.' The Council deprecate that only in mere concession to Irish sentiment an Irish architect should be associated with an English architect in designing and carrying out the proposed public offices (College of Science) in Dublin. It resents the imputation conveyed publicly that, in the opinion of the authorities of His Majesty's Treasury, there is not in Ireland an architect of sufficient reputation and capacity to design and carry out such a work as sole architect in the usual manner."

Sir Thomas Drew said that they were very careless in Dublin in exhibiting architectural works. They had ample opportunity for exhibition purposes at the Royal Hibernian Academy, and this privilege, in his opinion, should be availed of as much as possible.

On the motion of Sir Thomas Drew, seconded by Mr. R. O'Brien Smyth, the report was unanimously adopted.

The hon. treasurer read the statement of accounts, which showed a balance in hand of 91<sup>1</sup>/<sub>2</sub> 7s. 1d., which left their position better by 25<sup>1</sup>/<sub>2</sub> than last year.

The following members were elected as Council for the ensuing year:—C. J. MacCarthy, Sir Thomas Drew, R. C. Orpen, W. M. Mitchell, J. Rawson Carroll, A. E. Murray, G. P. Sheridan, F. Batchelor and G. Geoghegan.

A resolution in favour of the registration of architects was proposed by Mr. Frederick Shaw and seconded by Mr. Harry Allbery.

Sir Thomas Drew said that he was one of those opposed to

egistration, and he would move as an amendment that no steps be at present taken in the matter.

Mr. Murray seconded the amendment.

Mr. J. Rawson Carroll suggested that the original motion be withdrawn. In his opinion it should be the parent institution in London which should first move in this matter.

After some further discussion the motion was withdrawn and the proceedings terminated.

The annual dinner subsequently took place in the Shelbourne Hotel, at which the president, Mr. G. C. Ashlin, also took the chair.

After the cloth had been removed, the Chairman gave the toast of "The King," which was loyally honoured, and the toast of "Queen Alexandra, the Prince and Princess of Wales and the other members of the Royal Family."

Dr. Trail, in proposing the toast of "The Learned Profession," said it was an extraordinary thing that in England they were discussing the religious question which was settled long ago in Ireland. With regard to the medical profession, he observed that Sir Thomas Myles warned young men against joining the Army Medical Service, and Surgeon Ormsby said they should avoid becoming dispensary doctors. Both gentlemen were wrong. The Army Medical Service was a splendid one and should not be run down. With regard to dispensary service he might say that if Irishmen refused to take up appointments there were many men from Edinburgh and Glasgow who would be ready to step into their shoes.

The toast was drunk with enthusiasm.

Most Rev. Dr. Donnelly replied.

Sir Christopher Nixon, in responding for the medical profession, said the Institute of Architects had held its own amongst the other professions, and they had only to look at the magnificent buildings of Dublin to recognise what splendid work Irish architects had done. No one could represent the profession more worthily than their distinguished President. Regarding the medical department of the Army, he thought it afforded an excellent service for young medical men to embark upon. Many improvements had been made in it, and it now offered a good career. He must say that if he had a son entering the medical profession he would advise him to choose the Army Medical Service in preference to any other service in connection with the profession. It was not so in the Irish Dispensary Service, and he was quite at one with the President of the College of Surgeons when he urged the young members of the profession to work together to get better recognition for their work.

Surgeon Ormsby, in responding, said he believed the attitude he had taken up regarding the young members of the medical profession was the right one.

Mr. Charles Stanuall also replied.

Sir Thomas Drew proposed "Our Guests," which was responded to by Canon Hogan, Mr. J. H. Ryan, Professor Thrift and Colonel Plunkett.

Mr. O'Neill, chairman of the Dublin County Council, proposed "The Royal Institute of the Architects of Ireland."

The Chairman, in responding, expressed the pleasure he felt at the presence at the dinner of a representative of the Royal Hibernian Academy, and suggested the advisability of starting an architectural school as distinct from the sculptural school in the Academy, which would attract young men desirous of entering the profession.

During the evening a very enjoyable musical programme was rendered by Messrs. H. and E. Broadberry, Evan Cox, J. Horan and Dan Jones.

## THE LIVERPOOL HOUSING SCHEME.

THE housing committee of the Liverpool City Council have recently taken a survey of the work which lies before them. The result is to show that an immense amount remains to be done before a thoroughly healthy city can become possible. The Corporation have undertaken, says the *Manchester Guardian*, to demolish and clear away great areas of insanitary property near the centre of the city and to build in their stead good and wholesome houses, to be let at low rentals to the poorest part of the population. It is estimated that this work will ultimately cost about one million and a half of money. There are no fewer than ten thousand condemned houses to be swept away and replaced by habitable dwellings. The Corporation, it should be explained, have not formulated any comprehensive scheme for dealing with their task. Their main object is to house the people who are unhoused from the condemned areas, and to do this properly requires caution and a careful adaptation of the amount of building to the housing needs of the moment. They will go on steadily demolishing and rebuilding until the Augean stable is cleared out and the poor workers of Liverpool have a fair chance of living healthy lives.

The history of housing in Liverpool is in some ways remarkable. For the past forty years the Corporation has been

using its powers under local Acts and destroying bad property here and there. But until recent years very little was done of a constructive kind. The natural consequence has been a good deal of overcrowding, and this the municipality is now doing its best to relieve. For the past six years constructive reform has been in the forefront of the Corporation's programme. As areas have been cleared dwellings have been erected on the sites until now some seven separate blocks of dwellings, of varying description, are to let to tenants. These municipal houses are bright spots in a dreary picture. How dismal the picture is can only be learned by exploring these dark byways and observing the life that is lived in them. The general description of court property in Liverpool is well known.

The houses contain three rooms, placed one above another, the staircase leading direct from one room to the other. In many instances little if any sunlight can get to the courts, and the atmosphere within the dwellings is always foul. The houses are placed back to back and side to side with one another, and have no adequate or through ventilation. They are closely arranged in courts, which are approached by narrow passages, these in most instances being converted into tunnels by the extension over them of the room usually occupied as a bedroom. Extreme dilapidation, long-continued neglect and inattention, filth-saturation of porous materials combine with the original vicious construction of the property to render it unfit for human habitation.

These words of the Medical Officer of Health give some idea of the ten thousand houses which are now happily doomed to be destroyed. High, narrow courts whose walls shut out the sun and air; hundreds of the old cellar dwellings; rickety houses tottering to a fall, with sanitary arrangements of a barbarous kind—with all these things is it any wonder that the death-rate is high? As to the death-rate, there is no gain-saying the hard statistics of the medical authorities. In two of the areas most recently condemned, the annual death-rate for the three years 1898-1900 was 40.4 and 49.3 per thousand respectively, and of this a large proportion consisted of the deaths of children under five years. Dr. Hope says of one of these places:—

"It is identified with the history of disease and mortality in the city, and its records are those of suffering and misery. From time to time it has come into conspicuous prominence owing to outbreaks of disease of exceptional severity."

Nothing in Liverpool is very old, but much of this property is almost as old as the city, and figures on maps made at the beginning of last century. Some years ago the parks committee of the Corporation wished to brighten the homes of the poorer citizens by distributing flowering plants to be put in their windows. But in these worst slums the kindly proposal could not be carried out. The councillors were advised that in such air flowers had no chance of life, and their plan was abandoned. What chance of life had the human child?

The housing policy of Liverpool is distinguished by two definite characteristics. First, it is a cardinal point in the programme to provide for the poorest part of the population. The Corporation is attempting to house the docker, the casual labourer and the hawker rather than the better-to-do artisan. This being the case, they have done nothing towards erecting workmen's cottages on the outskirts of the city, relying on an improved train or tram service to carry the workers to and fro. The persons who at present inhabit the condemned rookeries are nearly all employed in or about the docks and the river-side. The average wage among them ranges probably from eighteen shillings to one pound a week. Their conditions of employment are precarious and casual. The housing committee therefore consider it the wiser plan to rehouse the dockers in healthy houses on the sites of their present dwellings, so that they can remain near their work. The question of building on the outskirts is left over for future consideration. It is noticeable that the Medical Officer of Health in his successive reports has urged the desirability of rehousing at least a portion of the unhoused tenants on land on the fringe of the city. It is generally felt that on purely sanitary grounds this would be a good course, and it is possible that experiments in this direction will be made. An interesting experiment in housing the very poor was made a few years ago by Mr. Boulnois, then the city engineer. Mr. Boulnois's plan was to build tenements so cheaply that they could be let at a unit charge of about one shilling per room. Gildharts' Gardens, a block of about ninety two-roomed houses, was the result. The place is plain even to severity, but it is thoroughly sanitary. The rents of some of the holdings are so low as half a crown a week. The experiment in this extreme form has never been repeated. The many dwellings erected since have been more generous in design and accommodation, and the average rent is between four and six shillings. The Corporation have built one great block of "barrack" dwellings in Victoria Square (which correspond roughly to the Pollard Street or Oldham Road dwellings in Manchester) and one smaller block. With these

exceptions, all the Corporation houses are on very much the same plan. They are a sort of combination or happy compromise between the block dwellings and the small independent house. The flat system is followed throughout. The houses are for the most part two or three roomed, and the rents vary roughly from 2s. 6d. to 6s. a week. In nearly every instance the tenant has his separate entrance, separate scullery and conveniences, and often a good yard. The houses are strongly built, and the space is ingeniously utilised. The outside appearance is sometimes attractive, and contrasts with the squalor around. In one block, the Dryden Street houses, there is the added luxury of hot water. Here, too, there is a recreation-room for the use of the dwellers, and concerts are occasionally provided. Building is going on briskly in five other areas. Narrow streets are being made wide, and in place of court and alley there are rising hundreds of pleasant and sanitary homes.

The second outstanding feature of the work is that the Corporation are housing the unhouseed. No one is allowed to become a tenant of a Corporation house who has not lived in a house which the Corporation has demolished. This restriction naturally increases the difficulty of the problem. The tenants of the new houses are drawn from the most shiftless part of the population. For many of these people rescue from the old conditions means the start of a new life. The instinct of cleanliness revives, and they come to take a pride in making their modest dwelling comfortable and pleasant. Help is given in many ways by the wise supervision of the Corporation officials. Up to the present time the Corporation has housed 6,250 persons, of whom 4,500 were unhouseed for demolished dwellings.

A word on the financial aspect of the question. The cost of demolishing the 9,943 structurally insanitary houses has been estimated at 342,000*l.* A further cost of 250,000*l.* will be involved by the purchase of property which is not insanitary, but which will be necessary to obtain sites for rebuilding. The sum of 592,000*l.* therefore represents, roughly, the minimum cost of demolishing the structurally insanitary property in Liverpool and of acquiring suitable rebuilding sites. Adequately to rehouse the dispossessed persons it is thought that at least 6,000 houses will have to be erected, and this will cost 900,000*l.*, bringing up the total estimated expenditure in round figures to one and a half million. The houses already erected and those now in course of erection have cost together 227,129*l.* The charge on the city as the result of the housing and demolition work of the Corporation (after deducting the money received in rents) is about 21,000*l.* each year, which represents a rate of 1*1*/<sub>2</sub>*d.* in the pound. If the Local Government Board consent definitely to extend the period for repayment of loans the yearly indebtedness may be considerably reduced, and there are those who affirm that were the period for repayment fixed at eighty years the housing work of Liverpool would cost the rates not a single penny.

### THE ASSIOUT DAM.

A MORE picturesque situation than that of Assiout, says the *Daily Telegraph*, cannot well be imagined. The thriving capital of Upper Egypt lies in a fertile plain at the foot of the Libyan Mountains. In front of its domes and minarets flows the Nile, wide and peaceful as a lake, and on the other bank is a noble belt of palms quite a couple of miles long. The weir is situated about half a mile below the town, just below the intake of the great Ibrahimyah Canal, which affords the main water supply of Middle Egypt and the Fayoum. It consists of 111 arches of masonry, and is rather more than half a mile long. It was built by Messrs. Aird in a period of less than three years and a half, and has already been submitted to the severest of all tests—that of holding up the Nile in flood—with complete success. During the months of May and June 1900 the average daily number of men at work upon it was 13,000. The special difficulty to be overcome in its construction was that of the foundation, for it is literally built upon the shifting sand. But the engineers of to-day have profited by the experience of their forerunners, and every problem has been adequately met. The barrage rests upon a platform of masonry 87 feet wide and 10 feet thick, which is protected on both sides—and here comes in the skill of recent days—by a continuous and impermeable facing of cast-iron sunk to a depth of 23 feet beneath the bed of the river. Whilst the work was in progress Sir Benjamin Baker tells us that the water had to be kept down by the uninterrupted use of seventeen 12-inch centrifugal pumps, throwing enough water for the supply of a city of two million inhabitants, while in a single season as many as a million and a half sandbags were used in the construction of temporary dams. At the western end of the barrage is a lock which is large enough to accommodate the *Rameses*, the most bulky steamer on the Nile. Whilst the work was in progress many new difficulties had to be coped with. Sometimes the working

of the powerful pumps drew the sand from beneath the foundations, so that liquid cement had to be poured in under pressure to fill up the gaps; at others springs—to the number of 1,000 in all—burst up through the sand, each requiring special treatment. But all this is over now, and there seems no reason why, under the supervision of the permanent staff, the Assiout barrage should not stand firm for ever.

Assiout is about 250 miles from Cairo, 350 miles further up, just beyond Assouan, the Nile rushes between black granite rocks, to form the series of rapids known as the First Cataract. It is here, through the very heart of the cataract, that the third and grandest dam has been built. The idea of checking the current at this spot is by no means a new one; even an untrained eye can appreciate the advantages of the site. But the credit of proving that it was the best possible, and of devising a practical scheme for its utilisation, belongs to one man alone, Mr. Willcocks, formerly director-general of reservoirs in Egypt. This great engineer, to whom Egypt owes so many reforms, worked out a plan by which a reservoir could be formed to store 3,700 million cubic metres of water above a series of curved dams. Unfortunately this would have involved the submersion of the temples on the island of Philæ. In order to prevent this Mr. Willcocks was asked to draw up fresh plans for a single dam, which should maintain a less quantity of water—under a third of that originally intended—at a somewhat lower level. This new design is the basis of the work of which the foundation-stone was laid by His Royal Highness the Duke of Connaught on February 12, 1889, and which was opened in state on Wednesday.

The completed barrage is a truly stupendous monument of industry and skill. Looking from the hills at either end one sees a solid arm of masonry a mile and a quarter long, thrust straight across from one side of the valley to the other. The greatest height of the wall is 130 feet, two-thirds that of the Monument; the width of its base is 100 feet, and its top, along which a light railway runs, is as wide as Fleet Street. It is pierced by 180 openings, through which, when the river is in flood, 15,000 tons of water may pass every second. The difference between the water level on the two sides is 67 feet, and the total masonry weighs over a million tons. All this would be very wonderful if the structure had been erected upon terra firma. It becomes almost awe-inspiring when we reflect that it was carried out in the midst of raging torrents, angrily seeking by night and day to sweep away the intruding obstruction. And it must be recorded, to the everlasting credit of all concerned, that the work was carried out well within the stipulated time, and for much less than the contract price.

It was not, of course, possible to span the whole river at the same time; the various channels into which the "cataract" is broken by the intervening islands had to be attacked separately. The plan of action was uniform and comparatively simple in theory, though great and special practical difficulties cropped up in some places. The first thing to do was to get a section of the river bed dry. This was effected by enclosing it between temporary rubble dams or "sudds," and then removing the water by means of powerful pumps. Stones up to twelve tons in weight were tipped in to form these dams; in one channel even blocks of this size were washed away by the force of the current, and so railway waggons loaded with stones and bound with iron wire—each weighing in all fifty tons—were dropped into the stream, and eventually proved effective. The rubble dams were made watertight by means of sandbags, and the exhaustion of the contained water by pumps proved an easier task than had been anticipated. Not so the next stage in the proceedings—the laying of the foundations. To do this the mud had to be dug away till soft rock was found; this was then blasted until the hard, living rock was reached. The amount of rotten rock was very variable, but on the whole much greater than had been anticipated, so that the foundations are in places some 40 feet deeper than had been expected. Once the foundations were laid, building proceeded apace. While the river was low all hands, up to 12,000, were crammed on to the work, which for a time proceeded by night as well as by day. Various portions were in different stages at the same time, and the visitor could see in one place the building of a sudd, in another the blasting of the rock, and in a third the laying of a coping-stone on the parapet—all on the same day. In one respect the conditions at Assouan differed widely from those at Assiout. The latter is a city of 50,000 inhabitants, within eight hours of Cairo; the former has a population under 15,000, is 22 hours from Cairo, and but 35 miles from the tropics. A new town had hence to be built, supplied and doctored. The contractors, Messrs. Aird, spared no effort in the interest of their workmen's health and comfort, and were rewarded by their remaining notably free from serious illness. An excellent hospital was equipped, with separate wards for the various nationalities, and no expense was grudged in the provision of drugs and appliances. Well-qualified European doctors were in charge, and one of them, Dr. A. T. White, now of the Egyptian Sanitary Service, devised a plan by which

the risk of death from heat-stroke—the temperature sometimes reached 122 degs. in the shade—was minimised. At numerous points in the works area he had tents raised, each surmounted by a Geneva cross, and containing a bath, an ice-box and a telephone. If a man fell down from the heat he was put in the bath, ice was added to the water, and the doctor rung up; when the latter arrived he found the patient already under treatment. This ingenious arrangement proved a great success; the loss from the heat was reduced to almost imperceptible proportions.

So much for the actual work. What is to be the result? It is hoped that not only will a largely increased area be brought under cultivation, but that much land which at present yields but one crop a year will be enabled to bear twice in the season. Something in this direction has already been attained. In 1900 the Cairo barrage saved the cotton crop in the Delta from utter disaster, and only this summer the prompt action of Mr. Webb in closing the Assiout barrage while the Nile was in full flood rescued Middle Egypt from a very probable famine. This barrage will, it is hoped, by retaining more water for the Ibrahimyah Canal bring 300,000 acres of additional land under the plough. When we remember that land in Egypt is usually rented at from 6% per annum per acre upwards the value to the country can be guessed, if not fully estimated. Lord Cromer reckons that the recent improvements in the Cairo barrage have doubled the cotton crop of Egypt, which means an annual gain of over 5,000,000*l.* As for the Assouan dam, it is too early to speculate on its effects. Certain it is that a lake nearly 150 miles in length will be formed above it, a lake which it has been estimated would extend from London to Nottingham, and still have enough water left over to fill Windermere. The contents of this reservoir will be doled out to Egypt drop by drop, in exact proportion to the needs of the land. Thousands of acres of desert sand will be converted into fertile fields, other thousands will be transformed from scanty pastures into rich plantations; but this is not the end. Further plans are already in the air, and a new dam is already talked of, up at Khartoum maybe, or perhaps on the Blue Nile, which shall assure the prosperity of the Soudan as well as of Egypt. Expeditions are at this moment on their way to investigate this problem, and much curiosity is felt in Egypt as to the results which will be arrived at. But all are confident that the future is safe in the hands of those who have brought the agriculture of Egypt to its present good fortune. Foremost among these are Lord Cromer and the Under-Secretary of State for Public Works, Sir William Garstin. It would not be fair to omit reference to the labours of Sir Benjamin Baker, as consulting engineer, and of Mr. Blue, as manager, and to the fact that the financial side of the problem was settled at the outset by Sir Ernest Cassel.

#### ROYAL ACADEMY SCHOOLS.

ON Wednesday evening Sir Edward Poynter, P.R.A., distributed the prizes to the successful students of the Royal Academy Schools at Burlington House. There was a large attendance of Academicians and Associates, as well as of the students and their friends. Prior to the distribution of the prizes, the President remarked that the members of the Royal Academy who had been examining the works this year wished him to say that in the two competitions of sets of six drawings from the life and four models from the life, as well as in paintings from the life, there was a very great advance and a much higher average in the quality of the works than had been remarked for the past two or three years. The prizes were then distributed as follows:—

Landscape painting, a tangled hedgerow: treated as a foreground, Creswick prize (30*l.*), Catherine Oules; painting of a figure from the life (open to male students only), silver medal, first, Frederick George Swaish; second, William Ewart G. Solomon; painting of a head from the life, silver medal, first, Henry Walter Peake; second, Frederick George Swaish; painting of a draped figure (open to female students only), silver medal, first, Alice Palgrave Walford; second, Ethel Mary L. Kendall; cartoon of a draped figure, a Sibyl, silver medal and prize (25*l.*), Walter Ernest Webster; design in monochrome for a figure picture, Sisera and Jael, Judges, ch. iv., v. 22, Armitage prizes, first (30*l.*) and bronze medal, Alfred William Sangster; second (10*l.*), Walter Ernest Webster; design for the decoration of a portion of a public building, dawn: an allegory with at least seven figures, prize (40*l.*), William Ewart G. Solomon; set of six drawings of a figure from the life (open to male students only), first prize (50*l.*) and silver medal, Frederick George Swaish; second (25*l.*), Frank Samuel Eastman; third (15*l.*), William Ewart G. Solomon; fourth (10*l.*), William George Simmonds (disqualified owing to having received a superior prize in the same competition before); drawing of a head from the life, silver medal, first, Ernest Townshend; second, Marian Alice Dibdin; drawing of a statue or group, silver medal, first, Maddison

Branch Fisher; second, Ernest Townshend; perspective drawing in outline (open to painters and sculptors only), the interior of Syzergh Castle in the Victoria and Albert Museum, silver medal, no competition; model of a design, Hagar and Ishmael, Genesis, ch. xxi., v. 19, first prize (30*l.*), Mary Constance Buzzard; second (10*l.*), Frederick Brook Hitch; set of four models of a figure from the life (open to male students only), first prize (50*l.*) and silver medal, Charles Leonard Hartwell; second (20*l.*), Charles James Pibworth (disqualified owing to having received the same prize before); model of a bust from the life (open to female students only), silver medal, first, not awarded; second, Elsbeth C. P. Rommell; model of a design containing figure and ornament, a panel for a drinking fountain, with a bronze spout in the centre, silver medal, Charles James Pibworth; model of a statue or group, silver medal, first, Leonard Jennings; second, Frederick Brook Hitch; design in architecture, a picture gallery for a country town, travelling studentship (60*l.*), James Black Fulton; set of architectural drawings, the hall of Eltham Palace: inside, showing roof, silver medal, first, Percy Ion Elton; second, Victor Wilkins; set of architectural designs (upper school), prize (25*l.*), Fitzroy Hyde Darke; set of drawings of an architectural design (lower school), prize (10*l.*), Alfred William Blomfield; plan of a building, a formal garden, prize (10*l.*), George Thow Smith; original composition in ornament, silver medal, no competition; perspective drawing in outline (open to architects only), the interior of Sir Christopher Wren's Court at Hampton Court Palace, silver medal, George Albert Hill. A Landseer scholarship in painting of 40*l.* a year, tenable for two years, has been awarded to William Charles Penn; the second Landseer scholarship in painting, and both Landseer scholarships in sculpture, were not awarded.

The President, in conclusion, said that he congratulated the students on a competition in which only one prize in the whole series was withheld.

#### SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE usual monthly meeting of the Society of Antiquaries of Scotland was held on Monday night, Dr. David Murray, vice-president, in the chair. Dr. T. H. Bryce read a paper on "The Cairns of Arran," a record of further excavations during the season of 1902. Although this season's explorations have yielded few relics, and unfortunately no human osseous remains, they have provided certain data regarding the structural features of the sepulchral cairns, which are of considerable importance, and it was now possible to describe the original condition of these remarkable megalithic structures with some approach to certainty. The chief interest centred in the excavation of a large cairn, a hundred feet long by sixty feet in breadth, at the head of Kilmory Water. At one end of the cairn is a circular setting of stones, two of the members of which form the side stones of a portal, leading into a chamber which occupies one end of the cairn. This chamber was roofed in by five large flagstones, which rested on smaller flags built on one another, so that the courses successively overlapped each other inwards. The upper section of the chamber walls was thus built of small stones, like a dry-stone wall, but the deeper portion, on the top of which this wall was built, consisted of massive blocks set opposite each other on the marginal outlines of an oblong rectangular span, or narrow and trench-like chamber; subdivided into four compartments by massive slabs set across it. Entrance to the chamber is obtained through a very low portal placed some distance above the floor at one end of the chamber, the other end being closed by a tall slab extending from floor to roof. Each compartment of the chamber contained much charcoal, but beyond a chipped flake of flint and some minute fragments of bone, nothing was found. The well-known monument, called the Giant's Grave, at Whiting Bay, was next explored. It consists of a series of very large blocks of stone set opposite to each other, so as to form a trench-like chamber, originally also covered by a cairn, the remains of which extend to a length of 98 feet, with a breadth of 69 feet, and at the end at which the chamber is placed there are two standing stones at each corner, suggesting that there may have been a setting of stones round the portal as at the Kilmory cairn. The megalithic structure probably represents only the basal portion of the chamber walls. The stones are of very unequal heights, and it is probable that a walling of smaller stones was built upon the top of them to a uniform level on which the roofing flags were laid. One of these, a flag of very large size, still leans against the wall of the chamber. The chamber contained a considerable quantity of burnt human bones, and in the soil which formed its floor four leaf-shaped arrow-heads, three oval-shaped knives of flint and a number of fragments of pottery were found. Some of the pottery undoubtedly belonged to the type of vessel which has been found associated with neolithic sepulchral structures in the south-west of Scotland. Other structures of the same type were examined at Monamore, Glen Cloy and Monyguil. The general conclu-

sions reached last year that the megalithic chambers in Arran belong to the late Stone Age have been fully borne out, and it has now been ascertained that the denuded megalithic cists represent the basal portions of chambers which were roofed in by large flags resting on an upper walling of smaller stones superposed on the basal megaliths, and that while in no case is there a passage of approach to the chamber, there was probably in all a portal of entrance at one end from a circular or semicircular setting of standing stones in front of it. In the second paper Mr. Alfred W. Johnston gave some notes on the site of the so-called Earl's Palace at Orphir, Orkney, and the ruins of the round church there. In the "Orkneyinga Saga" it is stated that Earl Harald lived at Orfjara, and that in the year 1136 Earl Paul kept his Yule feast there. The farm buildings and a large drinking hall are referred to, and it is mentioned that a splendid church stood before the hall door, but lower down the slope. The purpose of the paper was to record the results of the author's investigation of the question of the site of the Earl's residence, which was merely one of the mensal farms of the earldom. The parish of Orphir takes its name from the homestead, which signifies a reef or neck of land connecting a tidal island with the mainland. Originally the name included the earl's estate of Orphir, Midland and Honton, to which latter is attached a tidal island called the Hohn of Honton, and described in Old Norse as Orfir-is-ey. The present homestead of Orphir is at the head of the bay of that name. Between the farm buildings and the shore is the parish church with the churchyard, in which are the ruins of the round church, the whole of the apse and part of the nave of which still remain. It is undoubtedly one of those twelfth-century churches (and the only one in Scotland) that were built in the period of the Crusades, in imitation of the Church of the Holy Sepulchre at Jerusalem, and was probably erected by Earl Hacon after his return from the Holy Land. In 1899 the grave-digger came upon foundations which appeared to correspond with the south wall of the earl's residence, and in the two following years this clue was followed up by the writer and Mr. Robert Flett of Bellevue, till the wall was excavated for a distance of 136 feet, and a door found corresponding with the description in the Saga. The whole site was covered with 5 feet of debris mixed with bones, shells and ashes. No manufactured relics were found, except the finely ornamented top of a comb of bone of the late Viking period. It is now proposed, in connection with the rebuilding of the parish church further to the west, to excavate the ruins of the round church that it may be preserved as an ancient monument. In the third paper Mr. Francis Lynn gave an account of the discovery of two cists containing urns at Longcroft in Lauderdale. The site was a small knoll below Longcroft farm. The core of the knoll is silurian rock, which has been quarried at one side. In May last some children discovered part of an urn sticking out of the quarry brink, and this led to the careful excavation of the knoll by the Messrs. Dickinson, Longcroft. The urn was found to have been placed in a cist in an inverted position over a deposit of burnt bones. At a little distance, and almost in the centre of the knoll, was another cist covered by a very large slab. At the bottom in the west end was a finely ornamented bowl-shaped urn of the food-vessel type. Both urns were exhibited by the Messrs. Dickinson. Mr. A. J. S. Brook also exhibited a fine silver medal or badge, the property of Miss Wright, having on one side the Royal arms and on the other St. Andrew with his cross and the inscription:—The Associated Sons of St. Andrew, a Club instituted at Edinburgh, 1807.

#### BIRMINGHAM ARCHÆOLOGICAL SOCIETY.

A meeting of the Society held in the Council Room of the Midland Institute on Wednesday, under the presidency of Mr. Howard Pearson, an interesting account of the monumental effigies in St. Martin's Church, Birmingham, was given by Mr. W. Fowler Carter, who has made a study of the subject. Mr. Carter gave a general history of the four monumental effigies which are now in the chancel of the church, and which dated from the latter part of the thirteenth century to the latter part of the fifteenth. He dealt with the earliest ascertainable positions occupied by the monuments, and of the treatment they had experienced since their erection. The first, he said, was possibly an effigy of Sir William Bermingham, who was killed at the battle of Evesham while fighting on the side of Simon de Montfort. Mr. Carter thought, however, that it was more likely to be that of his son of the same name. This effigy was cross-legged, and it was quite possible that he may have been a crusader. On that point the lecturer disagreed with the latter-day authorities, who thought that the crossing of the legs was not the sign of a crusader. The second was a dreadfully battered monument on the north-east corner of the chancel, and very likely was that of the most eminent member of the family, Sir Fulk Bermingham, who was a contemporary of Edward III, served under him at Crecy and the siege of Calais. Sir Fulk was probably at the battle

of Poitiers, and for many years was Knight of the Shire for the county of Warwick. The third and most beautiful of the monuments was an alabaster tomb usually said to be that of Sir John Bermingham, but Mr. Carter considered it more probable it was that of his brother Sir Thomas, who was in the retinue of the Earl of Warwick in the French wars. The fourth monument was probably that of another Sir Fulk Bermingham, who was master or warden of the Guild of St. Thomas, which fact accounted for the rather unusual robes he wore. The lecture was illustrated by lantern slides prepared from drawings by Miss Blake, of the School of Art.

#### GENERAL.

**The King** received Sir Edward Poynter (president) and Mr. F. A. Eaton (secretary) of the Royal Academy in audience on Monday, when His Majesty signed the diplomas of the recently elected Academicians.

**Mr. William Henry Barlow**, of High Combe, Old Charlton, president of the Institution of Civil Engineers in 1880, who died on November 12, has left estate valued at 68,014*l.* 17*s.* 11*d.* gross, including personally valued at 50,042*l.* 8*s.* 5*d.* He bequeathed, after the death of his widow, to the Institution of Civil Engineers his portrait by Mr. Collier.

**Four New Churches** are to be erected in Leicester at a total cost of 24,000*l.*

**A Report** has been prepared by the experts, MM. Bunel and Debric, architects, of the Paris Préfecture of Police; M. Girard, chief of the Municipal Laboratory; and M. Ogier, chief of the Laboratory of Toxicology, relating to the causes of the death of Emile Zola, the novelist. They have concluded that the cause of the suffocation arose from the defective condition of the chimney in the bedroom.

**William Morris's Home** "Red House," Bexley Heath, was sold this week at the Mart, Tokenhouse Yard, for 2,850*l.*

**The Imperial Academy of Art**, St. Petersburg, has appointed a committee to consider the project for the erection of a palace of art adapted for exhibition and which would cost about a million of roubles, exclusive of decoration.

**Dr. Walter de Gray Birch**, who was long at the head of the MSS. Department at the British Museum and for twenty-two years secretary of the British Archæological Association, has been appointed librarian and curator to the Marquis of Bute.

**Convocation** granted on Tuesday 100*l.* out of the Craven Fund to Arthur J. Evans, M.A., Fellow of Brasenose College, to assist him in continuing his researches in Crete.

**The Royal Society of British Artists** have resolved to add to the number of members who practise in water-colours. For this purpose a special election will be held on January 12. The names of candidates will be received up to January 3.

**An Extraordinary Meeting** of the members of the Royal Architectural Museum has been called for Friday next, the 19th inst., at 4 o'clock, Tufton Street, Westminster, to affix the Common Seal of the Royal Architectural Museum to an agreement between the Museum and the Architectural Association, and to appoint a liquidator. After the special business, presentations will be made to Mr. J. P. Seddon and Mr. Maurice B. Adams, in recognition of their services to the Royal Architectural Museum. Sir Wm. Emerson, president, will take the chair, and a good attendance is anticipated.

**M. Alexandre Bertrand** has died at the Château of St. Germain, of the museum in which he was the curator, at the age of eighty-three. His fame as an archæologist was world-wide. He was a pupil of the Ecole Normale who, in 1848, was appointed member of the school of Athens. He was one of the original founders of the museum of St. Germain, which contains the largest and most varied collections of objects illustrating the Celtic, Gallic, Gallo-Roman and Roman past of the nation which exist anywhere in the world. Ever since 1862 he has been its curator, and at the same time professor at the Ecole de Louvre of National Archæology. At the Academy of Inscriptions and Belles-Lettres he occupied the chair of Littre.

**The Bursley Park Estate**, in Hampshire, has been sold for 300,000*l.* It is expected that the mansion will be rebuilt at a cost of 60,000*l.*

**A Memorial** of bronze on red alabaster, containing a medallion portrait of King Alfred encircled with oak leaves, has been erected in the church of St. Nicholas Cole Abbey. Underneath is the inscription:—"Alfred the Great. Born 849, died 901," with the following words of the king:—"I desire to live worthily all my days, that after death I might leave to my successors a memory of good work done."

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**ASHTON-IN-MAKERFIELD.**—Dec. 31.—Designs, &c., are invited for the enlargement of the Infectious Diseases Hospital. The architect whose plans are accepted and approved will be retained by the Council to carry out the work at the usual professional charges. Plan of the hospital site, together with full particulars of the alterations and extensions required, may be obtained from Mr. T. Burgess, surveyor, at the Council Offices.

**BRIDGWATER.**—Feb. 28.—Plans, specifications and estimates are invited in competition for power and appliances to deal with the accumulations of silt in portions of the river Parrett. Mr. W. T. Baker, town clerk, King Square, Bridgewater.

**CAPE TOWN.**—Jan. 31.—The Council of the University of the Cape of Good Hope invite designs for the erection of university buildings. Premiums of 400*l.*, 200*l.* and 100*l.* will be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

**DURBAN (NATAL).**—Dec. 18.—Designs are invited for new town hall, library, museum, art gallery and municipal offices. Three premiums of 500*l.*, 300*l.* and 200*l.* respectively will be awarded for the three best designs in order of merit. Mr. W. H. Radford, C.E., Albion Chambers, Nottingham.

**HULL.**—Jan. 31.—Designs in competition are invited for the extension of the town hall. Premiums of 300*l.*, 200*l.* and 100*l.* are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

**KINGSTON-ON-THAMES.**—Jan. 15.—Plans and designs are invited for a central home and cottage homes for children of both sexes in the Kingston Road, in the parish of New Malden. A premium for the first three selected plans of 25*l.*, 15*l.* and 10*l.* respectively is offered. Mr. Jas. Edgell, clerk, Union Offices, Coombe Lane, Kingston-on-Thames.

**MOTHERWELL, N.B.**—Designs are invited for the erection of buildings suitable for a public library. Mr. James Burns, town clerk, Municipal Offices, Motherwell.

**ST. IVES, CORNWALL.**—Jan. 31.—Competitive plans are invited for the erection of municipal buildings, to consist of a guildhall, council-chamber, jury room, public hall, town clerk's office, surveyor's office, treasurer's office, muniment room, parochial office, mayor's parlour and fire-brigade station and offices. Premiums of 70*l.* and 30*l.* respectively will be awarded to the architects whose plans and specifications are considered to be first and second in order of merit. Mr. Edward Boase, town clerk, Town Clerk's Office, St Ives, Cornwall.

**SCOTLAND.**—Competitive designs are invited in connection with the erection of a new poorhouse at Motherwell. Premiums of 25*l.*, 20*l.* and 15*l.* are offered for selected plans. Mr. John Miller, Inspector of Poor, Parish Council Office, Motherwell.

**SURBITON.**—Dec. 16.—Designs are invited for erection of a Coronation memorial clock tower near the refuge in the area fronting Surbiton station. Premium 10*l.* 10*s.* Dr Coleman, chairman, clock committee District Council Offices, Surbiton.

## CONTRACTS OPEN.

**ALSTON.**—Dec. 17.—For erection of a vicarage at Nenthead, near Alston. Messrs. Hicks & Charwood, architects, 67 Westgate Road, Newcastle-upon-Tyne.

**AUSTRALIA.**—Dec. 22.—For erection at Perth, Australia, of a rubbish destructor capable of dealing with forty tons of garbage in eight hours. Mr. W. E. Bold, town clerk, Town Hall, Perth.

**BEXHILL.**—Dec. 15.—For extension of engine-room, boiler-house and offices at the electric light works, for the Town Council. Mr. George Ball, borough surveyor, Town Hall, Bexhill.

**BLACKPOOL.**—Dec. 18.—For erection of a branch police station at Hawes Side. Mr. John S. Brodie, borough surveyor, Town Hall, Blackpool.

**BRADFORD.**—Dec. 17.—For following alterations, viz (1) workmen's rooms, Hammerton Street destructor, (2) municipal milkshop, Manchester Road. Mr. F. Stevens, town clerk, Town Hall, Bradford.

**BRIGHTON.**—Dec. 23.—For the construction of the permanent way of the tram roads in London Road, St. Peter's Place, York Place, Pavilion Parade, and Old Steine, &c, including the bonding and all contingent works, and paving with wood the whole of the area of such roads, including the tramway tracks. Mr. Francis J. C. May, surveyor, Town Hall, Brighton.

**CANNOCK.**—Dec. 17.—For whole of the works required in connection with new system of drainage for the Union Workhouse, including about 2,800 yards of stoneware pipe drains. Messrs. Willcox & Raikes, engineers, Union Chambers, 63 Temple Row, Birmingham.

**CHISWICK.**—For erection of a wall at the sewage disposal works. Mr. John Barclay, surveyor, Town Hall, Chiswick.

SPECIALTY.

ERECTION OF ROUND FACTORY CHIMNEY-STACKS

ON THE

"CUSTODIS SYSTEM,"

With Specially Constructed Patent Blocks.

Alphons Custodis Chimney Construction Co., SHEFFIELD.

**DARLINGTON.**—Dec. 15.—For erection of an ornamental bandstand (exclusive of base) at North Lodge park. Mr. W. George Winter, borough surveyor, Town Hall.

**DOVERCOURT.**—Dec. 19.—For erection of an underground convenience in Stour Road, Dovercourt. Mr. Henry Ditcham, borough surveyor, 7 West Street, Harwich.

**DUDLEY.**—Dec. 15.—For additions to the technical schools, Stafford Street, Dudley, and an underground convenience at the Market Place, Netherton. Mr. John Gammage, borough surveyor, Town Hall, Dudley.

**DURHAM.**—Jan. 5.—For erection of new Board schools at Heworth. Mr. H. Miller, architect, Felling.

**ESSEX.**—Jan. 7.—For erection of the Carnegie free library at Grays, Essex, and for furnishing, lighting and heating the same. Mr. Christopher M. Shiner, architect, 6, 7 and 8 Crutched Friars, E.C.

**GLOUCESTER.**—Dec. 20.—For alterations and additions to the Tuffley Board school, Gloucester. Mr. Walter B. Wood, architect, 12 Queen Street, Gloucester.

**GREAT AYTON.**—Dec. 29.—For erection of proposed new police-station, &c., at Great Ayton, Yorks. Mr. Walter H. Brierley, county architect, 13 Lendal, York.

**HALIFAX.**—Dec. 15.—For erection of an extensive block of high-class shops, showrooms, workrooms, &c., in Commercial Street, Halifax. Mr. W. Clement Williams, architect, 29 Southgate, Halifax.

**HALIFAX.**—Dec. 18.—For erection of nineteen houses at High Road Well. Mr. Medley Hall, architect, 29 Northgate, Halifax.

**HASTINGS.**—Dec. 22.—For alterations and additions to the public convenience, Mercer's Bank, Rock-a-Nore, Hastings. Mr. B. F. Meadows, town clerk, Town Hall, Hastings.

**HERNE BAY.**—Dec. 17.—For erection of pavilion, bandstand, reading-rooms, lavatories, &c., at East Cliff, Herne Bay. Mr. Edward White, clerk, Urban District Council Offices, Town Hall, Herne Bay.

**HIGH HARRINGTON.**—Dec. 15.—For erection of a dwelling-house at High Harrington, Cumberland. Mr. Charles W. Eaglesfield, architect, Gordon Street, Workington.

**HUDDERSFIELD.**—Dec. 17.—For erection of a Wesleyan church at Longwood. Mr. J. Berry, architect, 3 Market Place, Huddersfield.

**HULL.**—Dec. 19.—For alterations and additions to the isolation block at the sanatorium, Hedon Road. Mr. Joseph H. Hirst, city architect, Town Hall, Hull.

**HULL.**—Dec. 31.—For erection of thirty-four artisans' dwellings in Rustenburgh Street. Mr. Joseph H. Hirst, city architect, Town Hall, Hull.

**IRELAND.**—Dec. 15.—For the erection of a warehouse at Franklin Street, Belfast. Mr. Henry Seaver, architect, 126 Royal Avenue, Belfast.

**IRELAND.**—Dec. 16.—For erecting an ornamental wooden shelter in the Esplanade, Bangor, county Down. Mr. J. Milliken, clerk, Town Hall, Bangor.

**IRELAND.**—Jan. 1.—For erection of priest's house at Glenville, co. Cork. Mr. Samuel F. Hynes, architect, 21 South Mall, Cork.

**IRELAND.**—Jan. 6.—For erection of cottages in the various townlands of Strabane. Mr. J. E. Sharkie, clerk, District Council Offices, Strabane.

**IRELAND.**—Dec. 23.—For erection of a new Crown post-office at Limerick. Particulars may be obtained at the Office of Public Works, Dublin.

**LEEDS.**—For alterations to and partial rebuilding of warehouses, shops and offices in Park Lane, Leeds; tendering for the drainer, bricklayer, mason and concrete, carpenter and joiner, plasterer, plumber and glazier, slater and painterwork required. Messrs. Mosleys, rent collectors, 6 Wormald Row.

**LEWISHAM.**—Dec. 15.—For providing and erecting a fire-escape staircase at the union workhouse. Mr. H. C. Mott, clerk to the Guardians, 286 High Street, Lewisham, S.E.

**LEYTONSTONE.**—Jan. 5.—For erection of Norlington Road schools, Leytonstone, Essex. Mr. William Jacques, architect, 2 Fen Court, Fenchurch Street, E.C.

**LONDON.**—Dec. 15.—For erection of a blacksmith's shop, &c., at the Wandsworth Borough Council's wharf, Ashlone Road, Putney Embankment. Particulars may be obtained at the Surveyor's Office, 4 High Street, Wandsworth.

**LOWESTOFT.**—Dec. 15.—For construction of seven groynes and the lengthening of the four existing groynes upon the South Beach at Lowestoft, Suffolk. Mr. W. T. Douglass, 15 Victoria Street, Westminster, S.W.

**MALDON.**—Dec. 17.—For erection of a ward block of 10 beds, administrative block and other buildings in connection

**CONTRACT OPEN.**

CHELSEA.—Dec. 17.—For pulling-down certain buildings numbered 143 to 165 (odd), Sydney Street; and Nos. 244 to 248 (even), King's Road, Chelsea, with their appurtenances, and clearing away the materials and debris from the site, and for the erection of hoardings around the site. Mr. Joshua Dowl- ing, Clerk to the Guardians, Guardians' Offices, 250 King's Road, Chelsea, S.W.

**ELECTRIC NOTES.**

MR. JAMES A. ROBERTSON, chief electrical engineer with Messrs. Denny Brothers, Dumbarton, has been appointed electrical engineer for Greenock, at a salary of 250*l.* per annum.

AT last week's meeting of Dundee Town Council, it was reported that Mr. W. H. Tittensor, electrical engineer, had been offered the appointment of electrical engineer of Preston. Ex-Provost Brownlee stated that he had advised Mr. Tittensor to delay accepting till the Town Council had an opportunity of saying whether they would raise his salary, and he moved that his salary be raised from 400*l.* to 500*l.* On objection being taken by a member to this, Mr. Tittensor approached ex-Provost Brownlee and had a conversation with him, and the latter, rising, said he had just been informed by Mr. Tittensor that he had felt honourably bound to accept the Preston appointment. It was agreed to take steps to appoint a new engineer for Dundee.

**TRADE NOTES.**

ALL SAINTS CHURCH, Lockerbie, N.B., is being fitted with their "small tube" hot-water heating apparatus by Messrs John King, Ltd, engineers, Liverpool, employing their latest improved economical coil heater.

THE Selby Urban District Council have given instructions to Messrs. Wm. Potts & Sons, clock manufacturers, Guildford Street, Leeds, to fix a large size Cambridge quarter chime clock with four large external dials in the tower of Selby Abbey.

THE tender of the Columbian Fireproofing Company, Ltd., 37 King William Street, E.C., has been accepted by the Lancashire and Yorkshire Railway for fireproof floors at their new offices, Nos. 10, 11 and 12 Great College Street, West-

minster, and they have just completed their work at the New Medical Schools, Cambridge, for Mr. E. S. Prior, M.A., of 3 Old Serjeants' Inn, Chancery Lane, E.C.

THE London Fireproof Plate Wall Company, Ltd., inform us that they have secured under tender the contract for the whole of the divisional partitions for workmen's dwellings in Regency Street, Westminster, for the Westminster City Council. They were in competition with several other firms, but the housing committee recommended their manufacture. Messrs John Mowlem & Co. are the contractors. The same company are also erecting their partitions in the four large blocks of artisans' dwellings now in course of completion at High Street, Stoke Newington, the property of the Four per Cent. Dwellings Company, for which Messrs. Dove Bros. are the contractors.

**VARIETIES.**

A NEW Board school is being built at Leytonstone; the architect is Mr. Jacques, of Fen Court, Gracechurch Street, London.

MR. SHINER, of Crutched Friars, London, E.C., is the architect for the new Carnegie free library about to be erected at Grays, in Essex.

MR. HENRY GILMAN, the energetic and successful manager of the Crystal Palace, died at his residence at Upper Norwood on the 3rd inst. He will be greatly missed by the personnel of the Palace, amongst whom he was very popular.

THE Chancery Lane Safe Deposit Company have for the fifth time during the last ten years added an extensive annexe to their immense area of safes and strong rooms, which are, we believe, the largest in the world.

THE Mayor of Sheffield in his speech on the occasion of his elevation to the civic chair, incidentally remarked that those who were interested in archaeology and antiquarian matters would realise that the acquisition by the Corporation of the old half-timbered house in Tenant Street as auxiliary offices would insure its being carefully preserved as a relic of days gone by. The house in question, formerly in the possession of the late town clerk, is the quaintest bit of Old Derby yet remaining intact. It was probably built in the "spacious times" of Queen Elizabeth, say about 1483. The house is but little known to Derby people, and when first seen has a somewhat startling effect, for there is nothing in the structure fronting the street to give a clue to the highly-picturesque

# BRITISH MANUFACTURE

## HIGH-CLASS ENAMELS

### For all DECORATIVE WORK.

---

#### "O" QUALITY "INDIAN" QUALITY

FOR INSIDE USE. FOR OUTSIDE USE.

building behind. A single step seems to take you from the atmosphere of the twentieth to that of the fifteenth century.

THE new burgh school at Rutherglen, N.B., was formally opened by Colonel J. M. Denny, M.P. for the Kilmarnock burghs, on the 6th inst. The new building takes the place of a former school, which was removed on account of its want of accommodation for the increased number of pupils attending it. The present edifice will give accommodation for 1,000 pupils, and has cost 13,000*l*. The style of the building is a simple treatment of English Renaissance. The elevation to King Street has two gables, with large flat oriels terminated with scroll pediment. On the front to King Street are the principal entrances used for infants. Here are also the playgrounds and latrines for boys and girls. There are two large gateways for boys and girls respectively. The north front is very imposing, showing the staircase windows going up with arched tops with two tower-like parts on each side. At this frontage are the entrances for the boys and girls of the higher standards from High Street. The plan of the school has a large central hall, with classrooms on either side. The infants are on the ground floor, and the higher standards on the two upper flats. The masters' and assistants' rooms are on the ground floor, near the entrances to the school. There are ample cloak-rooms, both for infants and the higher standards. The cooking-room and the chemistry-room are on the upper flat, with kitchen attached. The school is well lighted, the hall having a roof-light the whole length.

ALL SAINTS CHURCH, Claverley, six miles from Bridgnorth, was reopened for divine worship on Sunday, the 7th inst.

The restoration has been carried out in accordance with the plans of Mr. W. Wood Bethell, and the estimate of the architect was 4,500*l*. The work included the necessary repairs to roofs and walls, the lowering of the floor to its original level, and so unearthing the bases of the Norman columns, the removal of the galleries and thereby restoring the fine proportions of the nave. The plaster and whitewash have been taken from the walls, and this led to the discovery of some rare examples of Norman art. They are of unique interest on account of their exceptionally early date (1170), and the principal subject represented. This is an incident in the battle of Senlac or Hastings. The incident, evidently intended as the motif of the painting, suggested to the vicar of Claverley (the Rev. T. W. Harvey) a clue to the meaning of the whole, namely, that the painting is a pictorial representation of the personal encounter recorded in the "Roman de Rou" between Roger de Montgomery and a gigantic Englishman, captain of 100 men. To account for its existence upon the walls of this church it must be remembered that Earl Roger was the builder of the church and the founder of the chapter of canons associated with it, and also that by the ruling caste and their clergy the Norman Conquest had been invested with a semi-religious halo; it had not only been solemnly blessed by the Pope, but had received the sanction of success. The other paintings in the spandrels of the arcade and elsewhere are of a more ordinary character—the incidents in the lives of saints, the torments of hell, and figures of the seraphim, &c. The borderings throughout are of a very elaborate character, red, yellow and pink being the colours principally used.

## BUILDING AND BUILDERS.

THE Australian Government has accepted a tender for the construction of an outer harbour at Port Adelaide. The cost will be nearly half a million.

THE Malvern District Council has decided to acquire additional land near the old gasworks at a cost of 1,200*l*. The Council appointed a committee to prepare a scheme for the erection and working of a public library.

A SCHEME for the enlargement of the public baths has been adopted by the Gainsborough Urban Council. A swimming bath, 71½ feet long and 20 feet wide, will be provided, the cost of the additional length being estimated at 800*l*.

## THE LONDON VENTILATING STOVE

Specially Adapted for Hospitals, Infirmarys, &amp;c.

ECONOMISING FUEL. MADE IN TERRA-COTTA.

A continuous current of fresh air is admitted through a shaft beneath, warmed by contact with the chambers at back, and discharged into the Ward or Dormitory at an agreeable temperature.

THE Aston School Board have appointed Messrs. Cossins, Peacock & Bewlay, of Birmingham, as architects for the new schools in Fentham Road, the cost of which is estimated at 4,700*l*.

THE Birkenhead Board of Education have conditionally approved the plans submitted by the School Board for the erection of a higher elementary school in Conway Street, adjacent to the General Post Office, for the accommodation of 330 boys and 350 girls.

THE foundation-stone of a new Independent Methodist church at High Park, Southport, has been laid. The new building, situated in Old Park Lane, will be built at a cost of 1,400*l*, and take the place of a small structure facing High Park Road, built twenty-two years ago.

A LOCAL Government Board inquiry has recently been held into the application of the Town Council to borrow 2,273*l*. for purposes of street improvement, 100*l*. for the construction of a footbridge over the Colne near Middle Mill, and 11,693*l*. for defraying the balance of the cost of the town hall.

At a meeting of the Ayr School Board the clerk (Mr. John Douglas) reported that the Department had approved of the plans for the new school prepared by Mr John Eaglesham, Ayr. It was decided that the new school should be known as New Park school.

SINCE the scheme for building a new workhouse at Evesham was defeated the expenditure of large sums in additions and improvements to the old buildings has been agreed to. A new infirmary has been erected, and at the last meeting of the Board of Guardians estimates for new tramp wards and offices amounting to 4,500*l*. were submitted.

THE Swinton and Pendlebury District Council are considering the adoption of a scheme for dealing with the sewage of the district, which will involve an expenditure of close upon 10,000*l*. The Salford Corporation's new cemetery is in the neighbourhood, and there is a likelihood of new works being built there.

THE Manchester Council has sanctioned the contribution from the city of 3,200*l*. towards the cost of rebuilding the Blackley Reformatory. The total cost of the rebuilding will amount to 19,000*l*., of which 9,000*l*. is being given by the

Lancashire County Council and the Manchester and Salford Councils.

NEW buildings, costing about 4,000*l*., are to be erected at Carnoustie station, N.B. The plans have been finally adjusted by the railway authorities and work is to be commenced immediately. The question of a new station is one that has been raised repeatedly by the municipal authorities of the burgh, and as far back as three years ago the railway companies promised to erect suitable buildings.

At a meeting of the sewage disposal committee of the Carlisle Town Council it was decided to recommend the Council to adopt a scheme for treating the sewage of the city on the bacteriological system, according to a report prepared by Professor Dibdin and Mr. Markes, city surveyor, at an estimated cost of 60,000*l*. The scheme provides for pumping apparatus sufficient to pump six times the normal dry weather flow as required by the Local Government Board.

A LOCAL GOVERNMENT BOARD inquiry has been held into the application of the Fylde Water Board to borrow 159,407*l*. for the construction of a new reservoir to hold 332 million gallons of water at Grizedale Lea, Burnace-with-Bonds. Mr. T. Loftus, clerk to the Fylde Water Board, said that 137,727*l*. was required for the new reservoir, 20,000*l*. for the general extension of the water main, and 1,680*l*. for miscellaneous work.

NOTICE has been given that in the ensuing session of Parliament the trustees of the late Mr. G. A. Baird, of Auchmedden, Aberdeenshire, intend to apply for a provisional order to endow Pennan Harbour Trustees with power to construct and maintain new harbour works. These operations comprise a new west pier or breakwater. Power is also sought to borrow money for the purpose of the order and to levy harbour dues.

At the next meeting of the Worcester Urban Council the water and sewage committee will ask for authority to obtain tenders for the first section of the sewage disposal works, for which the Local Government Board approved a loan of 52,000*l*. in January 1901. The finance committee propose to borrow 50,000*l*. at 3½ per cent. and expenses amounting to 15*s*. per cent., to cover various loans for which the Local Government Board's sanction has been already obtained.

NON-FLAMMABLE WOOD  
By its use alone can any Building be rendered Absolutely Safe from Fire.

HEAD OFFICE AND WORKS: TOWNMEAD ROAD, FULHAM, S.W.

STOVES  
BRATT COLBRAN & CO.  
10 Morlimer St. London, W.

THE present workhouse at Gloucester has been condemned for some years as altogether inadequate, and a few years ago an excellent site was obtained at Suffley, on which the Board decided to erect a new workhouse, hospital and cottage homes. Then a new Board was called into existence, and the whole scheme was shelved. The Local Government Board latterly have pressed the Guardians to come to some final decision. It was eventually decided to send a deputation to the Local Government Board on the matter.

THE bridge committee of the Workington Town Council recommend that application be made to the Local Government Board for sanction to borrow the necessary sum with which to complete the works in connection with the bridge and approaches connecting Northside with Workington; the sum to be total cost of the works as estimated by the engineer, less the 5,000*l.* which the Workington Corporation Act of 1899 authorises the Corporation to spend without sanction, and the further sum of 7,500*l.* which has been applied for from the County Council as the amount of their contribution towards the works.

### BUILDING BY-LAWS REFORM.

A MEETING was held at 29 Bloomsbury Square on Monday on the question of oppressive building by-laws. Sir William Chance, Bart., was elected to preside. After an address, in which he referred to cases of hardship under oppressive by-laws in various parts of the country, the Chairman moved the following resolution:—"That in consequence of the general complaints about the oppressive nature of the model by-laws (drawn up originally to meet the needs of urban districts only) in rural districts or rural portions of urban districts, it is thought that the time has come for the formation of an association for the purpose of drawing public attention to the matter, and it is hereby resolved that an organisation (to consist of the persons present, with others who have given their assent, or who may hereafter do so, and pay a minimum annual subscription of half a guinea) be now formed, to be called the Building By-law Reform Association, to promote amendments of building by-laws so as to limit official control of private buildings to what only the public health and safety demand, and thus remove encroachments on individual liberty."

The resolution was seconded by Mr. E. D. Till, and supported by Mr. A. H. Clough, Mr. W. M. Acworth, Mr. Anderson Graham, Mr. Christopher Turnor, Mr. Mark Judge, Mr. E. L. Lutzens, Mr. Thackeray Turner, Mr. A. H. Vowell, Mr. Lacy Ridge and Mr. R. W. Schultz. The resolution was carried unanimously. After considerable discussion the following resolution was also passed:—"That the special objects of the Association be—(1) To promote the adoption of the new model building by-laws for rural districts (which are approved of and recommended by the Local Government Board) in rural districts or in the rural portions of urban districts where the old model by-laws are still in force. (2) To promote the adoption of the new model building by-laws for rural districts by the authorities of such districts, or of districts partly urban and partly rural where the authorities may wish to adopt building by-laws. (3) To promote amendments which will bring the by-laws of urban districts more into accordance with present requirements and modern science. (4) To secure some method of appeal to the Local Government Board or other authority, where the enforcement of any by-law would create a hardship and its non-enforcement could do no damage to the interest of the public generally. (5) To assist as far as possible, in suitable cases, those who may be oppressed in any way by building by-laws." A provisional council was elected, and Mr. R. A. Read, of 45 Parliament Street, was appointed secretary *pro tem.*

### STURTON CHURCH, NOTTS.

THE parish church of Sturton-en-le-Steeple, which was partially destroyed by fire on February 24, 1901, was reopened on Wednesday afternoon by the Bishop of Southwell, after undergoing complete restoration.

The church, which is dedicated to SS. Peter and Paul, consists of a western tower containing five bells, nave of three bays, with north and south aisles and chancel of three bays, the north aisle being continued to the first bay of the chancel, whilst a further continuation eastwards affords a spacious vestry. With the exception of the tower and the outer wall of the fabric, the whole church has been rebuilt, for although the nave arches remained standing after the fire, they were so shattered by its action that they had to be taken down, and, in like manner, the windows were so severely damaged that they

had to be replaced by new stonework. The oldest part of the church is probably the north wall of the chancel, which retains a small Norman window now open to the vestry, and many fragments of transitional Norman work have been discovered. In the thirteenth century the nave appears to have been built, and, though some of the capitals were afterwards altered, a portion of one of the originals was found, and has been embodied in the wall at the west end of the north aisle. It retains its carving, which is somewhat crude in character. The magnificent tower—a landmark for miles around—was built in the fourteenth century, and its original parapet may still be seen about halfway up the existing building, which was raised to its present height in the fifteenth century. The church was restored in 1871 under the supervision of the late Mr. Christian, when the low clerestory of the fifteenth and sixteenth centuries was removed and a high-pitched roof put on from end to end. During the present restoration a clerestory has again been added, and it has been carried to a greater height than the former one. The new clerestory possesses more architectural features than its predecessor, and adds greatly to the light and general effect of the church both internally and externally. The new roofs are of pitch pine, very handsomely designed, and with heavily-carved mullions. The screens which were destroyed by the fire have been reproduced as accurately as possible from careful study of photographs and the charred remains which were found. The other fittings are all new, and have been designed so as to accord with the general character of the church. The seating is now of solid oak, instead of pitch-pine, as provided in the former restoration. A particularly handsome sedilia, bearing the arms of the diocese of Southwell, has been placed in the chancel by Mrs. Harrison, the widow of a former vicar. The old floors, of somewhat poor tiles, have been superseded in the chancel by a flooring of red and white Mansfield stone, and by plain stone in the nave and aisles, where the seat spaces have all been covered with wood-block flooring. The reredos is of simply carved oak panelling, and the pulpit is also of oak, ornamented with beautiful openwork carving, supported upon a plain stone base, and opposite to it is a brass eagle lectern. In the chancel two interesting memorial slabs have been found, very little damaged, and bearing dates early in the sixteenth century, but the family monuments in the baptistry under the tower, being constructed of marble, have been hopelessly disfigured. The work of rebuilding the great arch of the tower was accompanied with very considerable difficulty owing to the great

superincumbent weight of the tower, and an elaborate system of underpinning had to be adopted. There was formerly a font of modern design in the church, but this was destroyed in the conflagration, and it has been replaced by a very old font from the disused church in the neighbouring parish of West Burton. With the exception of the reintroduction of the clerestory and the consequent alteration in the pitch of the roof, the restoration has been so carried out as to carefully reproduce the partly demolished church as it was before the fire. The whole of the work has been undertaken in accordance with the plans and designs of Mr. C. Hodgson Fowler, F.S.A., of Durham.

## GARDEN CITIES AND THE HOUSING PROBLEM.

THE "Garden City" has apparently come to stay as an attractive and practical solution of the housing problem. So, at any rate, think its promoters, men of such ripe experience and business knowledge as George Cadbury, of Bournville, and W. H. Lever, of Port Sunlight. These philanthropically disposed manufacturers have found out that it pays to make men and women as well as cocoa and soap, and they give their workers healthy conditions of life and homes to live in at reasonable rents. They recognise that this can only be done by removing their factories out of crowded centres to rural districts, where land can be bought cheap and of sufficient quantity to permit expansion.

The proposal is to buy sufficient land on which to build an entirely new town. The economic basis of the scheme is that the increase of land value thus created shall belong to the community, less 4 per cent. to go to the original purchasers until the community are prepared to buy them out.

The propagandist Association which was formed three years ago to make this project known has now a membership of 1,700, being an increase of 1,200 in one year. In the annual report about to be issued, it is also stated that the income for the past fourteen months has increased fourfold, and that nearly 200 lectures have been arranged to be delivered throughout the country during the winter. The Pioneer Company which has been formed to put the ideas into practice has now raised its full capital of 20,000l., and expects the public to provide the balance before the close of 1902. The directors are Messrs. Ralph Neville, K.C., Edward Cadbury, Ebenezer

### TRADES' TRAINING SCHOOL.

THE certificates and prizes awarded to students of the Trades' Training School were distributed on Monday night by Lord Monkswell at the Carpenters' Hall, London Wall. The School is carried on at 155 Great Titchfield Street by six of the City companies, namely, the Carpenters, Joiners, Painter Stainers, Plasterers, Tyllers and Bricklayers and Wheelwrights. Mr. Walter Smith (master of the Carpenters' Company) occupied the chair, and was supported by Mr. Percy Preston and Mr. F. A. Crisp (the wardens), the Master of the Painters' Company, Professor T. Roger Smith (chairman of the joint committee of the School) and Mr. H. Phillips Fletcher (director). A report on the work of the School during the past session was read by Professor Roger Smith, who said that he could honestly congratulate the allied companies on the uninterrupted prosperity of the School. Instruction had been given in eleven classes, and in some cases the work was the best that they had ever had. He mentioned that no students were admitted who were not in some way or other connected with the building trade. Lord Monkswell then presented the prizes to the students of the School, and afterwards distributed the certificates and medals gained at the Carpenters' Company's examinations in sanitary building construction and in carpentry. He stated, in the course of a few remarks, that he had recently had the privilege of visiting the School, and was pleased with what he had seen there. The associated companies had every reason to be satisfied with the work of the past session. In addressing the students a year ago Sir Michael Foster spoke of the necessity of their having an adequate basis of fundamental elementary knowledge. He hoped that they would take that observation to heart. Before launching out ambitiously they should try to ground themselves

on fundamental knowledge, as by doing so they would have a firm foundation to build on. The great object of the School was to make good workmen and not to provide facilities for artisans to enter the professions. To be a good workman was in itself an excellent thing. It was a pity that there were not more training schools of the kind. Technical education was of great importance in these days, and he was pleased to see that the City companies were supporting such an admirable institution. On the motion of the Master of the Painters' Company, a vote of thanks was accorded to Lord Monkswell.

### MUNICIPAL FLATS IN WOLVERHAMPTON.

ON Saturday afternoon the Municipal flats which have been erected in Green Lane, Wolverhampton, by the Corporation for the purpose of providing sanitary dwellings for the poorest class of people in the town, who now dwell in the courts and alleys, were inspected by a number of representatives of the Wolverhampton Trades and Labour Council. The deputation were accompanied over the buildings by Alderman L. Johnson (chairman of the housing committee) and Mr. George Green (the borough engineer).

In the course of a discussion a number of questions were put to Mr. Johnson, who stated that the idea of building the flats for the accommodation of Corporation employees had never been entertained. They were provided solely for that class of the poor who were unable to earn more than 20s. a week. So far as he knew there were no men working for the Corporation on the roads who earned less than 18s. a week, and such men would be eligible as tenants. The scheme of the housing committee was not an artisans' dwelling scheme, and artisans earning good wages would be debarred from occupying the flats. The housing of the poor, he contended, was a problem which would never be solved until the poor were provided with sanitary tenements at the rentals they were now paying. It was hoped to prevent overcrowding, and the two-roomed flats could be occupied by two adults and one child, and the three rooms by three adults and two children. A man, therefore, with a large family would not be eligible as a tenant. The speaker said the London County Council could obtain money at 2½ per cent, but Wolverhampton could not float stock under 3 per cent, and he emphasised his view that cheap money was absolutely necessary to carry on housing operations successfully.

## CABOT'S INSULATING & DEAFENING QUILT.

### A PERFECT DEAFENER.

Prevents the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this. Send for Special Book on Schoolhouse Acoustics, illustrated.

### A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Decay proof, and vermin-proof, and unflammable.

### FIREPROOF, DEADENING.

A fireproofing result infinitely superior to that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

### CABOT'S ASBESTOS "QUILT."

The only scientific deafener. Indestructible by decay, moths, or vermin.

	Per Bale.	Half Bale.
Single Ply ...	£1 : 11 : 0	£0 : 17 : 0
Double Ply...	1 : 16 : 6	1 : 0 : 0
Asbestos ...	2 : 16 : 6	1 : 10 : 0

Bales containing 500 square feet each; half-bales 250 square feet. Weights: Single-ply, 80 lbs.; Double-ply, 120 lbs.; Asbestos, 190 lbs. per bale.

## CABOT'S CREOSOTE STAINS, FOR EXTERIOR WORK.

Unequalled for depth and freshness of colour, durability, wood-preserving properties, and freedom from blackening. Superior to paint for exterior woodwork, and fifty per cent. cheaper. One gallon will cover 100 square feet of surface, two brush coats.

## THE B. & S. FOLDING GATE CO.

19, 20 & 21 Tower Street, Upper St. Martin's Lane, London, W.C.

No town in the kingdom had built houses of this class at the low cost of 40s. per room.

Replying to a question as to the area of the rooms, and whether the Corporation had broken their own by-laws in erecting houses of this character, Mr. Green stated that the by-laws provided that no room should have a less superficial area than 108 feet. The rooms in the flats had an area of 118 superficial feet.

After further discussion Alderman Johnson and Mr. Green were thanked, and there appeared to be a consensus of views that the Corporation had taken a wise step in providing such accommodation for the poor. On Friday the deputation will discuss the experimental scheme with the housing committee and the health committee of the Corporation.

### LONDON AND SOUTHAMPTON CANAL.

THE proposed canal to unite London with Southampton is regarded at the latter place as a scheme which, if carried out, would bring vastly more trade and shipping to the southern port. At the same time, if coal can be found beneath the chalk in North Hants, as geologists predict, both London and Southampton could be cheaply supplied with coal by means of the canal. At present the expense of transport to and from London is very heavy, for in addition to the railway carriage there is the expense of barging from Nine Elms, where there is often great congestion of traffic. All this would be avoided, as the same barge would take the goods direct from ship's side at Southampton to the London Docks, and *vice versa*. Formerly, and until recent times, a very large amount of traffic was sent from Southampton by the canal to Winchester. The water was taken from the river Itchen, one of the two rivers on which Southampton stands. This river flows by the docks and is navigable for barges as far as Woodmill, to which the tide flows—a distance of three miles. From this point the canal, or barge river, begins and extends to Winchester, about twelve miles distant. The locks and towing paths are dilapidated, but could easily be restored. This canal was first made in the reign of Richard Cœur de Lion and his successor by Godfrey de Lucy, Bishop of Winchester, who, by raising a vast mole at the head of the river near Alresford, formed a lake now called Alresford Pond, thus creating a reservoir for supplying the navigation. It was restored, after having fallen into decay, by a company of citizens at Winchester, who obtained an Act

for the purpose in the reign of Charles II. The average depth of water in the canal is about 5 feet.

### WOOD-WORKING IN SUSSEX.

WOOD-WORKING is one of the most ancient industries in the county, says the *Sussex Daily News*. It is, in all probability, older even than agriculture itself, for it was man's early attempts to make the trees of the forests of use to him that produced the first rude tools designed for preparing the ground for the reception of his seeds. Wood, at any rate, was in use before iron implements were fashioned. The principal wood-working industry in Sussex is that in regard to oak timber. This wood, both in abundance and in practical value, stands far ahead of any other kind. Sussex, in fact, is really famed for no other timber but oak, which has been called the "weed" of the county, because it thrives so well and grows so fast. It is an undisputed fact that Sussex has always been noted for yielding oak of the toughest and best quality in England. In the reign of Queen Elizabeth, when that royal and energetic lady was making one of her numerous peregrinations in the county, the vast quantity of splendid oak attracted her attention, and she is said to have exclaimed:—

"This is the most lovely district I have ever seen for producing oak for building ships for Her Majesty's navy; with a view of further encouraging its growth, I declare that all woodlands in Sussex shall be free from payment of any tithe for ever."

Few people indeed know that all Sussex woodlands are free from tithe, and that the utterance of Queen Elizabeth has been fruitful in many legal disputes. The outcome of this historical incident was a great stimulus to the industry of wooden ship-building with oak, which has up to within the last few years been carried on extensively all along the coast of Sussex, and particularly at the ports of Rye, Newhaven, Shoreham and Littlehampton.

As recently as forty years ago there were said to be 100 pairs of pit-sawyers at Rye alone, besides numberless shipwrights and others engaged in the industry. With regard to Rye, the wooden shipbuilding has somewhat revived during the last few years in the construction of flat-bottom boats used for carrying coal and a few fishing smacks for the east-coast trade. Early in the last century the Government requirements

for English oak for shipbuilding purposes were enormous, and in the "sixties" contracts for 60,000 loads of 50 cubic feet each, of the probable value of 500,000*l.*, were given out without difficulty. With the decay of wooden shipbuilding and the adoption of ironclads, the railway companies became some of the largest buyers of English oak for their trucks, but these trucks are now largely made from cheap wood imported from foreign countries to the exclusion of English timber, while many are being made of iron. One large source for the consumption of English oak was the erection of groynes for sea defences along the seventy miles of Sussex coast. A hundred years ago the consumption of the town of Brighton in this respect was very large. These, again, are often now made of cheap foreign wood and some of cement concrete.

Much interest attaches to the process of dealing with the oak tree, which is unlike that adopted in connection with any other timber. Oak is mostly sold to merchants in the early spring, and the first process, which starts usually about the third week in April, just as the sap begins to rise in the trees, is the peeling of the bark by gangs of men called "tan-flayers." The importance attached to this peeling of the bark is great, as any inexperience or carelessness on the part of the workers is liable to be attended with very serious results. The peeling season lasts from about the middle of April to the end of May. Ideal weather for the work is warm, sunny days, with cool nights, and a warm shower about once a week. "Flayers," as the bark-peelers are called, begin by taking off the first length of bark before throwing the tree. When the tree has been hewn the greatest care has to be exercised in taking off the bark, only experienced and conscientious men really doing it properly. This process of itself employs a great number of hands, and is the first harvest of the year. In the woodland districts of old good men were willing to work all the hours of daylight, and have been known to earn 40*s.* and 50*s.* a week, and even more, at this work. The bark is set up in a particular way for drying, and afterwards has to be harvested for a certain time, after which it goes through other processes before it is fit for use by the tanner of leather.

Sussex oak bark is always held in the highest estimation, and until recently the fixing of the price of best Sussex bark was a great event in the year for timber merchants and tanners alike. Bark is sold by the antique measure so puzzling to outsiders, viz. by the load of 45 cwts. hatched. The price of the article has been known to vary in comparatively recent times from 8*l.* a load to 42*l.* a load. Formerly, war times

greatly affected its value. But the oak-bark tanning industry, like the English timber trade generally, has decayed, and there are very few tanyards now left in Sussex, whereas formerly nearly every large village or parish had its own tannery.

Other kinds of timber are grown in Sussex besides oak, but for these the county is not specially noted. Elm usually grows on the good soils; beech to a considerable extent on the chalk hills in the western part of the county; and in the neighbourhood of Chichester there are saw-mills for making up beech for chairwork, though this industry for native wood has been well-nigh ruined by American competition. Ash of good quality is met with on many soils, and this is a wood in which foreigners have not as yet competed successfully. The fir tribes grow well in the forest districts in the north of the county, and of these larch is by far the most valuable wood. Chestnut, alder, poplar and birch also thrive on suitable soils, but cheap foreign woods have greatly reduced their value.

### PLUMBERS AND THE PUBLIC HEALTH.

DR. FARQUHARSON, M.P., presented the prizes to the successful students in the plumbing classes at the Robert Gordon's College, Aberdeen. Amongst those present were the president of the District Council for the National Registration of Plumbers, Professor Matthew Hay; Dean of Guild Lyon; Mr. Charles Stewart, Headmaster of the Robert Gordon's College; Councillor John Ross; Mr. Kenneth Cameron, sanitary inspector, &c.

In presenting the prizes, Dr. Farquharson referred to the great necessity for the registration of plumbers. He said the one great aim and object of the movement was to raise the position of the plumber, and to let people know that he wanted to do his work honestly and straightforwardly in the interests of the human race. The plumber had a great deal in his power as regards the sanitation of houses. If his work was not well carried out, then of course under our hidden system of sanitation great evils might arise. Under the ordinary system of sanitation people lived upon great sewers protected from them by traps, pipes, and other modern methods of sanitation, which, if not carried out in a workmanlike manner, might mean great destruction of human health and human life. They knew perfectly well that all diseases were water-borne, and if their water got in contact with their sewage almost

every disease they had could be communicated to the unfortunate household by bad or inefficient plumbing.

He referred to the endeavours made to carry the Bill, which had already passed the House of Lords, through the House of Commons, to place the registration system upon a statutory basis. What they wanted was a "hall-mark," by which it would be known that plumbers could be safely employed to carry out the difficult and dangerous duties which they are called upon to do.

He referred also to the recent deputation which waited upon the President of the Local Government Board, and the very encouraging reply of the President—that the registration system had the warmest approval and support of the Department and the Government generally.

### SCARBOROUGH MASTER BUILDERS.

THE Scarborough Master Builders' Association held its annual dinner at the Albemarle Hotel, Scarborough, on the 29th ult. Mr. A. W. Sinclair presided, and was supported by Councillor Mansfield, York, president of the Yorkshire Federation of Building Trade Employers; Councillors Maynard and Bland, Scarborough; Mr. H. A. Chapman, A.R.I.B.A.; Mr. R. H. Carr, hon. sec.; and Mr. B. Jowsey, vice-president.

After the loyal and patriotic toasts had been honoured, Mr. Horner proposed "The Building Trades," which was responded to by Mr. C. Peckett in a very humorous, entertaining and original speech, which was productive of much laughter.

Mr. R. H. Carr proposed "The Yorkshire Federation of Building Trade Employers." He referred to the fact that although the Federation had only been in existence a little over five years, it had done good work in settling many unfortunate disputes that had arisen. He referred to the yeoman services which Councillor Mansfield had rendered to the Federation not only during his year of office as president, but while a member of the executive.

Councillor Mansfield, in reply, thanked the company for the enthusiastic way they had drunk the toast and received his name. He expressed the pleasure it gave him to again be present at the dinner, spoke at length on the advantages of the Federation, and instanced many cases where disputes having arisen, and the matter having been put before the executive of the Yorkshire Federation, satisfactory settlements had been the

result. He instanced the bricklayers' dispute at Newcastle and others in the West Riding, and mentioned that only last week the settlement of the plumbers' dispute at Liverpool had been arrived at. He urged upon all the importance of amalgamation, and trusted the coming year would be the most successful they had had.

Councillor Bland proposed the "Scarborough Master Builders' Association" in a very happy and interesting speech. He traced the course of the Association since its formation in 1891, and said during the year he was President they had troubled times, but many disputes were settled amicably. He was happy to state that of late they had not been troubled with any labour disputes.

In responding to the toast, Mr. A. W. Sinclair expressed his pleasure at seeing such a large number present, and thought it augured well for the future of the Association. He endorsed the remarks of previous speakers and referred at length to the usefulness of such associations as theirs. The speaker instanced special cases where, had no Association such as theirs existed, disputes might have gone on unsettled for an indefinite period.

Mr. Oxley Smith proposed the "Architects and Surveyors," which was responded to by Mr. H. A. Chapman.

"The Corporation and Borough and Trade of Scarborough," was proposed by Mr. S. Woodhouse, and responded to by Councillor Maynard.

Mr. T. Jaram proposed "The Guests," and Mr. Ernest Bradley responded.

During the evening, the Westborough Press Quartette (Messrs. Morley, Barrett, Judge and Ditchburn), sang "The Frog" and "Home Sweet Home." Mr. H. Fenby sang in a very pleasing manner "Alice where art thou," and "Mary." Mr. Kenneth Metcalfe sang "The Village Blacksmith" and "I fear no foe," and in conjunction with Mr. Fenby gave an excellent rendering of the duet "Excelsior." Mr. R. H. Carr was the accompanist.

### INSTITUTION OF ELECTRICAL ENGINEERS.

AN ordinary meeting of the members of this Institution was held on the 4th instant, in the rooms of the Institution of Civil Engineers, Great George Street, Westminster, when the president, Mr. James Swinburne, delivered the inaugural address of the session.

The President said that they had been going ahead so very fast lately that they might be a little apt to have vague views of what they could and what they could not do electrically. It might be well, therefore, to try to look over some of the branches of their great and diverse industry, and see what obstacles were now opposing them, and what were likely to oppose them shortly, and whether the obstacles were insuperable or not. After pointing out that it was the great capital expenditure that wrecked schemes for obtaining energy from tides, he dealt with the question of water power. Some years ago there was a great deal of excitement about the development of water powers. The possibility of "harnessing Niagara" and utilising waterfalls all over the world was hailed as a great triumph over nature, and the idea was that power could be got for nothing, and industries would all migrate from coal districts to the neighbourhood of water powers. At the time of the excitement it was pointed out, largely in vain, that water power did cost something, because the development of a fall demanded a good deal of capital whose interest and depreciation had to be paid. If steam power cost one farthing a unit, and if water power at the same place could be produced for half a farthing the owner of the water power would claim the odd half-farthing as rent, or would just allow the water power enough to encourage the production of a new thing. As a rule, however, water power was not where it was wanted industrially. In the nature of things water powers were generally in hilly countries, and were never near the sea. The result was that water power, as a rule, could not command the same price as steam or gas, because it was not where it was wanted. A blast furnace was more valuable than a water power. There were plenty in England, but the owner who had been wasting the gas up to now would not give it away. He would want rent, so that it would only just pay to use his gas rather than make it. The electrical industry thus did not gain, but the ironmasters did. For many years "electrical energy direct from coal" had been the dream of the electro-chemist, that was to say, he had dreamt of an electrolytic cell in which the consumed electrode was carbon; but, to sum up the matter shortly in the light of modern theory, carbon never formed ions, and had therefore no solution pressure, and could accordingly give no electro-motive force. One of the chief disadvantages of steam-engines for stations with small load factors was the difficulty of storing energy so as to get uniform boiler load. Batteries were no longer used for this, and the difficulty reduced

the value of steam in comparison with the gas-engine. With very cheap gas the first thing was to make big engines, the next to make them so that they never broke down, and the last thing to make them efficient. The gas-engine might be, comparatively speaking, in the state in which Watt left the steam-engine, but it would doubtless make very rapid advances as it was in the hands of very competent and highly educated engineers. As to efficiency in dynamos, they had reached the practical limit already, for further reduction in dynamo losses would make no appreciable difference in the total efficiency of a station. They were not likely to make much advance in dynamos now, as they were limited by the hysteresis loss in iron, which prevented the use of higher inductions in armatures and low permeability, which limited their field and armature tooth inductions. It did not seem likely that they would now find iron much better in either respect. Nor were they likely to find a better available conductor than pure copper. As insulator they had mica. It looked therefore as if they were in sight of their limits in dynamo and motor designs. In alternating transformers there had been little room for improvement for the last ten years. The "ageing" of the iron was a trouble, but now there seemed little possible advance. The secondary battery had for a long time been on the border of success for traction work, both on tramways and on the road, and a further improvement in batteries might be expected to produce very great changes in important branches of engineering. The first question asked was, "Why do you stick to lead?" The answer was that the case was very special, and other things would not do. They were practically limited to lead, at any rate, in acid cells. Their limits in secondary batteries thus seemed to be settled by the need of having insoluble electrodes and insoluble coatings. The conductor itself could hardly be improved, but there was great room for improvement in the insulation. It was largely the insulation of the cables that limited their pressures, and therefore their distances of transmission. It was exceedingly unlikely they had reached the limit of insulation. There was no branch of electrical engineering so important as cable making, yet there was no branch of the industry which was run on less scientific lines. The days of secret mixtures known only to the workmen who made them might be passing away, but even now the whole art of cable making was a question of trial and error with a good deal of the last component. Engineers did not know now whether rubber was better than paper, nor could they tell what any particular make of cable would be like after

ten years' use. They did not even know how to test a cable. Their chief work until lately had been producing light. There the inefficiency and waste was prodigious, and though it was mostly unavoidable, there was still great room for improvement. They took great care over their stations, watching every penny from the coal-shovel or mechanical stoker to the station meter. They quarrelled over 1 per cent. in the generators, when they got to the mains they cared less, and once they had got to the consumers' meters they cared nothing at all. As to the arc light, they did not seem to have reached their limit as to light from pure heating, because they lost a lot of light into the opposite carbon. They could not say they had got anywhere near their limits of high temperature efficiency in running, low temperature in starting, or high pressure in the electrolytic lamp. It was absurd to attempt to consider the limits of the use of electrical transmission on railways at this date. The future of electric railways, electric tramways and automobiles was rather a matter of vague conjecture and picturesque prophecy. They might, however, say that they were limited by the want of either a variable speed, simple alternate-current motor, or a simple variable speed-gear capable of transmitting a very large torque and packing into an engine. In electric tramways there was no limit in sight. The power could be sent over any distance desired, and there seemed to be no limit to the people who wanted to travel on electric trams. The question of electrolysis was rather that of a limit to the duration of pipe companies' property. It was a very difficult question. Though the threatened effects of electrolysis had no doubt been exaggerated, it was at best a question of degree, and the ingenuity of engineers was continually reducing the chance of damage.

#### ENGLISH ENGINEERING.

THE annual meeting of the Leeds Association of Engineers was held on the 6th inst.

Mr. Alderman Wigram, a member of the firm of Messrs. Fowler & Sons, who supplied the greater part of the transport for South Africa, confessed that he had recently been struck with the enormous push and progress shown by America in all branches of the American trade. What was wanted in this country was more brains, not only in the masters, but in the foremen and the workmen. He often wondered how the Americans

managed to find the quantity of brains that they did. To some extent he thought it was because they were able to offer inducements to the best of our men to go over there. One constantly found Englishmen and Scotsmen at the heads of departments in America. At the same time the extraordinary improvement that had been made was no doubt due to the pains they took with the training of their workmen. The Americans had recently reverted to a system which we had given up long ago—the apprentice system for the training of young people. We looked upon that system as belonging to the Middle Ages, but our American friends had taken it, had modified it, and had brought it into their works. One striking point about it was that they were endeavouring to bring in and give advantages to those who had been trained in technical schools. A direct premium was placed by American master engineers upon technical education. Technical education in England was not producing, and probably never would produce, what they wanted—an intelligent and highly trained workman who still had a pride in his work; but the Americans had adopted a system which gave an advantage to the lad who came to the business after having spent some time in getting a technical training before he came. That was a method which he commended to engineers in this country.

The Lord Mayor (Mr. J. Ward) mentioned that some time ago he was travelling on the Continent, when he met an Egyptian engineer, who said that in Egypt they had come to the conclusion that the English locomotive was much superior to the American. This gentleman told him that they had carefully examined engines, and in point of workmanship and material an English engine surpassed all others. It was very gratifying to know that that engine had been supplied by a Leeds firm.

Mr. James Campbell expressed the opinion that there was a great future before English engineers. He had recently heard that a Leeds firm had secured a most important order for machinery in the face of the whole world in open competition, so that English engineering was not dead yet. In addition to this they now had the two new territories of the Orange River Colony and the Transvaal open to them, which were closed before, and if the English Government only looked to English interests and gave them a fair field they would have no reason to complain. If they kept up to date, got the best tools, looked to the question of cost, and relied on the quality, design and endurance of their work, they need not fear foreign competition.

# The Architect.

## THE WEEK.

THE result of the action *JACOB v. Corporation of Southend-on-Sea* should be taken as a warning by municipal authorities of the risks incurred in allowing roads to be used unless they are in a perfectly safe condition. The Corporation were constructing a sewer, and had sunk a shaft. The work was not carried out by their own workmen, but by a contractor. The earth had been thrown back over the shaft, but apparently had not been sufficiently rammed down. The plaintiff, who was driving along the road, caused the earth to subside; he was thrown out of his trap and seriously injured. The defence of the Corporation was that the soil was disturbed by an escape of water from a broken gully-pipe, for which they were not responsible. The jury found a verdict for plaintiff of 3,500*l.* damages. A stay of execution was granted on condition that 1,500*l.* was paid over within a fortnight.

LAST week we referred to the evidence given by one of the city officials before the Glasgow Housing Commission. In one sense the evidence of the medical officer of Glasgow is even more appalling. According to Dr. CHALMERS, 13·7 of the inhabitants live in "houses" of one apartment. But 22 per cent. of the deaths from all causes arose among the occupants, or an excess of fully 8 per cent. The deaths from phthisis among them were 2·5 per 1,000, while it was 1·8 in the two-apartment population. The overcrowding was, however, profitable. Tenants who paid from 7*s.* 0½*d.* to 8*s.* 3½*d.* per month were able to derive from sub-tenants sometimes 10½*d.* per night, sometimes 4*s.* 6½*d.* per week. Dr. CHALMERS asserted that 60 per cent. of the sub-tenants were drunkards, and he considered that it was too easy in Glasgow for a bad tenant to find accommodation. He maintained that the getting of a room should be rendered as difficult as possible. Some of the members inquired what should be done with the residuum which should not be allowed to hire rooms. The chairman said, "Reduce the residuum of the population to the smallest number you choose, how are you to deal with them?" The only answer the medical officer could give was the establishment of labour colonies or the erection of buildings in which such people would have to go through an educational process which would qualify them to become tenants of single rooms without being a danger to the neighbours. It is always well that a proposition should be reduced to its lowest and simplest terms. Half a century ago CARLYLE spoke about the fertility which would be possible for the Scotch hillsides were the Glasgow sewers once opened on them and the miserable lack-alls set to work at cultivation. If they disobeyed he had a summary remedy, "I will admonish and endeavour to incite you; if in vain, I will flog you; if still in vain, I will at last shoot you." The Glasgow evidence would indicate that the builder alone cannot solve the housing question, and that his efforts must be supplemented by measures of another kind.

M. OSIRIS by his munificence has made his name known to all Frenchmen. A rich man, he lives in the quietest way in Paris as if he were desirous to increase the fortune which he applies to the general good. Always opportune in his undertakings, it was felt he had selected the right time to restore the château of Malmaison, the site of the *mala mansio* of Mediæval days, from whence issued the feudal chief ODon, who waged war on the boatmen of the Seine. In 1798 JOSEPHINE BEAUHARNAIS obtained possession of it, and there NAPOLEON is said to have spent his happiest years. There was a likelihood recently that the building would be sold to the highest bidder, and M. OSIRIS resolved to purchase and restore it as one of the historic monuments of France. The work has been executed, and all that remains is to pay the bills. It is not easy to reproduce the style of the Consulate, which was a very graceful adaptation of the Roman. M. OSIRIS imagined that all the masonry required would be executed for 200,000 francs, or 800*l.* The contractor for the masonry, however, demands 431,563 francs, or more than double the

amount anticipated. M. HUMBERT, the architect, has had the bill reduced to 300,388. The experts employed have declared that the correct amount should be 225,315 francs. The joiner's bill was 67,169 francs, which is now reduced to 60,000. The painter's account has been brought from 27,543 to 16,747, and over 4,000 francs have been taken off the bill of the locksmith. The case has come into the Court, and nearly all the contractors uphold their demands. It is to be regretted that an amicable arrangement has not been possible, but although the French have a very elaborate system of builders' prices, it is not readily applied to restoration.

THE decision which was given by Mr. Justice BUCKLEY in *TOLLER v. SPIERS & POND, LTD.*, should at once lead to an amendment of the Factory and Workshop Act. All who enter the City from Blackfriars are acquainted with the City Mills in Upper Thames Street, which was the building referred to by his lordship. It has a very narrow frontage compared with its height, but it extends to the edge of the river. The building is occupied by two tenants, and is an example of the thoughtless way in which mills were erected several years ago. Although there is a basement and seven upper floors, and extraordinary length, there is only one staircase, which is close to Thames Street. The County Council served notice on the owner that adequate provision of escape in case of fire should be made. The owner was willing, and the tenant of the upper part was willing, but Messrs. SPIERS & POND as occupiers of the lower part declined. The owner, therefore, came before the Court in order to have it determined whether he could legally compel that firm to allow him on their premises in order to carry out the works demanded by the London County Council. Mr. Justice BUCKLEY, whose authority few lawyers would care to dispute, distinctly stated that the owner had no legal right to enter any part of the building occupied by the defendants or to carry out the works. When it is remembered that throughout England a great many factories exist which were originally erected for a single occupant, but have to be sublet, as well as others in which several tenancies were originally contemplated, the judgment is almost sufficient to have the Act considered as inoperative. In many cases we hope the tenants would agree in co-operating with an owner in order that measures of safety might be realised. On the other hand, it could not be said that Messrs. SPIERS & POND were exceeding their rights in opposing the landlord's proposal, and they had, no doubt, grounds for the course adopted. But similar reasons may prevail in other places, and, so far as can be discovered, the opposition of one tenant can nullify the provisions of the Act.

THE account which was given by Mr. CLOUDESLEY BRERETON of French rural education in the paper he read before the Society of Arts does not suggest that, as regards buildings, things are better managed in that country. Every commune must have a school of its own or must share in one; the former course is preferred, for only 2 per cent. of the communes have a school in common. In one instance, where the scholars numbered five, a school was erected at a cost of 800*l.* United districts, such as in England, would not be tolerated in France. As a result, out of 36,174 communes not more than 47 are without schools. They are generally kept in good repair, but the school furniture is rarely satisfactory. The love of art is gratified on very economical terms, for the big posters of picturesque scenery which are prepared as advertisements by railway companies are used for adorning the walls in many cases. The cost of a place in English Board schools is 14*l.* 12*s.* 8½*d.*; in France it amounts to only about 12*l.* The cost of building and furnishing is divided in the following proportions:—40 per cent. is paid by the State, 4 per cent. by the department, and 56 per cent. by the commune. Accommodation for teachers is not very generous; an assistant teacher is supposed to have two or three rooms, but they often have but one, and it may be without a fireplace. The teachers appear, however, willing to make sacrifices, knowing the importance of their work and the influence it will exercise on the France of the future.

PAINTERS' ARCHITECTURE: A TURKISH CASTLE.

### APPROVAL OF MATERIALS.

**A**FTER monopolising the attention of so distinguished a lawyer in commercial affairs as Mr. Justice WALTON and a special jury for nearly a week at Liverpool, the case *INGRAM & CLARKE v. HOLME & KING, Ltd.*, came to an end in the manner which was anticipated. It is not often so large a sum as 2,512*l.* 18*s.* 2*d.* is claimed for cement, but the money was perhaps of less consequence than the other issues which that sum served to represent. The case was, however, of the simplest kind, although it could have been carried on for fifty days as easily as for five. The most important principle at stake was the power which an architect or engineer possesses when his "approval" is made a condition in a transaction. On that account we propose to deal with the case by looking at it in its general relations to contracts for construction undertaken with architects or engineers as the chief authority.

The circumstances were as follows. The Liverpool Corporation having at great expense obtained a supply of water from Wales, found it necessary to provide an additional reservoir at Prescott. Concrete was to be employed to a large extent. The specification described the quality of the Portland cement which would be used, and it was stated that the engineer was to be satisfied with it, and if it failed in that requirement it was to be rejected. Messrs. *HOLME & KING, LTD.*, sent in a tender amounting to 98,450*l.*, which was accepted.

Several of the parties who submitted tenders made application to Messrs. *INGRAM & CLARKE* for prices for the supply of cement. It seems remarkable in these days, when so many complaints are heard about foreign rivals, that the principal English makers would not guarantee cement that would withstand the prescribed tests. There was however, no difficulty in finding Belgian cement that would be equal to the high tensile strength exacted. Messrs. *INGRAM & CLARKE* were, therefore, able to send a quotation to Messrs. *HOLME & KING*, agreeing to deliver cement at Prescott at the rate of 39*s.* 6*d.* per ton. There was no clause in the specification by which Belgian cement would be excluded. Messrs. *HOLME & KING* were, of course, anxious to have an adequate supply, as they were liable to a penalty of 100*l.* a week if the work was not completed at a stipulated time.

The contractors were informed by the engineer that the briquettes did not answer the seven days' test. At Messrs. *HOLME & KING*'s desire it was agreed that a 28 days' test should be substituted. Complaints were made to the plaintiffs in August of last year, especially in regard to two deliveries, one of 1,000 bags, and the other of 448 bags. The material was of the variety called "Scales" cement. Thereupon the plaintiffs arranged to supply another variety known as D. & H. cement, and the deliveries began in the following October. The latter was not found to be satisfactory by the Corporation engineer, and he refused to allow its use. The prohibition was a serious affair for all parties. The defendants employed 50 tons for experimental purposes, but, of course, not on the reservoir, and paid for them, but they were compelled to remove over 600 tons, and to store it in a warehouse, for which expense as well as for the loss entailed by the suspension of the operations Messrs. *HOLME & KING* counterclaimed.

The plaintiffs, for the sake of their reputation, were obliged to bring forward a great many witnesses to testify to the quality of the cement. A member of the firm of manufacturers stated that the same mixture of clay and chalk was used for the Scales and D. & H. brands, and he hesitated to say that there was any difference in quality between them. There was, no doubt, a reduction in price, but the reason for supplying the D. & H. at a cheaper rate was that the Belgian firm wished to meet Messrs. *INGRAM & CLARKE*, who had stated that their contract was not profitable. Scales was generally the cheaper of the two. About 17,000 tons of D. & H. cement were used by the Belgian Government at Bruges and there were no complaints, and it was never said that the cement set too quickly. Evidence was also given by contractors who had employed some of the cement rejected at the Prescott works to the effect that the cement was not too quick-setting. An expert also declared that from his tests he considered the cement quite suitable for work in the reservoir. One expert, consulted by the Admiralty in connection with harbour works, affirmed that the average tensile strength of a sample was 600 lbs., and the final setting time seven hours, which showed a slow cement. It was finely ground and sound. The tensile strength of another sample was 627 lbs. after seven days, the final setting taking place in thirty minutes. A further sample was received which had a final setting time of seven hours. The cements were adapted for practical purposes. Some briquettes were made from the last sample which stood the most severe test to which they could be subjected without showing any flaws. It is unnecessary to go at further length into the evidence for the plaintiffs.

All that was said must have been considered by lawyers as extraneous to the main point. The counsel for the defendants was acting more reasonably than often occurs when he asked that the case should not be allowed to proceed further. The plaintiffs had obtained a copy of as much of the specification as related to the conditions required for the acceptance of the cement, and knew that the engineer was to be satisfied. To this it was replied that the defendants had allowed about a thousand tons to be delivered, which was turned over and arranged for use, and that was sufficient to show there was satisfaction. The judge adopted that view and the hearing was continued.

For the defendants the resident engineer on the works stated that the second lot of cement was C. Z. instead of D. & H. There was another variety with a blank seal, besides one of a different brand. He described the tests which he had made and by which he was convinced that the cement was too quick-setting for the purposes required. One of the Liverpool Corporation inspectors said that a consignment after being conveyed in waggons from the mixing place to the place of deposit, a journey which occupied thirty-nine minutes, was found to be so hard that it had to be hewn out with picks and iron bars, rewatered and specially treated before it could be put into position. On various occasions the cement had set so quickly, whilst he was making tests, that the thermometers had become firmly embedded in the mass, and many were broken in the effort to remove them. Mr. FRANCIS FOX, one of the engineers of the *Marsey*

Tunnel, said that from its quick-setting qualities he would not allow the cement to be employed on any works with which he was connected. Mr. COTTRELL, engineer of the Liverpool Overhead Railway, gave similar evidence.

After other evidence had been heard and counsel on both sides had delivered addresses, Mr. Justice WALTON submitted the following questions to the jury:—(1) Whether the cement in question—this 1,000 tons—which had been rejected was supplied to the satisfaction of the Liverpool Corporation water engineer? (2) Was it rejected by the engineer? (3) Was it best Portland cement, reasonably fit for making concrete for a reservoir? And (4) on the assumption that the defendants were justified in not accepting it, what compensation ought to be allowed to them for the expense and loss they had suffered? To the first question a negative answer was given. The second, which was the most important, was answered in the affirmative. The jury could not agree on the third, and they awarded 420% in respect of the fourth, which related to the counterclaim.

The plaintiffs' purpose will no doubt be served although the issue was adverse to them. For there was no doubt about the strength of the cement, as it resisted very severe tests. It was, however, needed for a special purpose, and whether it met those requirements or not was to be determined by the engineer. It sometimes happens that with sub-contracts like the one in question the conditions which are binding on the contractor may not affect the sub-contractor, even if the latter knew about them. In this case a copy of the specification relating to the cement had been sent to the plaintiffs. It is not unusual for sub-contractors to give little attention to such documents. So much anxiety is now bestowed on the degree of grinding of cement and on tensile strength, it may be that the quality of setting was not sufficiently considered. But the setting power as well as the strength was left to the engineer without any limitation, and under these circumstances it did not matter whether experts were satisfied or the reverse. To some people it may seem that the importance attached to slow-setting cements is excessive; such an instance as the inspector described of a waggon load of stuff becoming a firm concrete in about forty minutes might have occurred very rarely, and could be explained if all the circumstances were taken into consideration. But it is a general belief among engineers that there is a connection between the setting and the burning, and that slow-setting is really a testimony to proper burning. How far that is true is open to discussion, but those who have to employ cement under difficult circumstances must be allowed to take comprehensive conclusions occasionally without any regard as to whether they are supported by laboratory experiments.

#### ANCIENT COFFERS AND CUPBOARDS.\*

DURING the next week men will be making night hideous in the suburbs of the Metropolis and some of the old-fashioned provincial towns by doleful renderings of "The Mistletoe Bough." That is the tragedy of an oak chest. The story was derived from Italy, but probably it originated in a more distant region. In modern times paper currency, banks and safe deposits have caused the old-fashioned chests to be regarded as lumber. But for many centuries they served an important purpose. There is evidence enough that in antiquity they were used to preserve treasures. One in which CYPSELOS, the tyrant, was concealed, was said to be made of gold, ivory and cedar, and richly carved. In the records of the Mediaeval period we have numerous references to them. Coffers were sometimes adorned with ironwork, enamels and precious stones. Thus in 1295 in the inventory of St. Paul's Cathedral, London, we read, "Duæ coffræ magnæ eburneæ, modo vacuæ." They sometimes were utilised for the secondary purpose of seats. There were also bahuts, or coffres des vaches, which seem to have been boxes covered with leather, and on journeys were carried by horses or mules of special strength, called bahutiers. The evolution of the

chest is suggested by the advancement in social position of the makers. The bahutier or coffrier was only recognised as an artisan; but when the trunks or chests became highly ornamented, and were known as huches or huchels (Sir JOHN MAUNDEVILLE speaks of "The arke or huchche, with the relikes, TYTUS ledde with hym to Rome, when he hac scomfyted alle the jewes"), the huchier was allowed the rank of a painter or sculptor. In Italy at a later period the cassone painter was usually a very able artist, and examples of his skill, which continue to be as brilliant as gold and colours can make them, are among the treasures of various museums. It would be easy to say more on the subject, which is among the most tempting that can be offered to the artist and the archæologist.

Mr. FRED ROE, the painter, is to be congratulated on having successfully employed his pen and pencil in the preparation of an attractive volume on ancient coffers and cupboards. It has occupied him as a labour of love for over seven years, and the result repays so much industry. His style of drawing is well adapted to the portrayal of old work, for both figures and ornament have characteristics which somehow are convincing of their fidelity. His own work is supplemented by photographs, and for once the two classes of representation agree together.

In "Cymbeline" IACHIMO is described as having obtained admission to IMOGEN'S bedchamber by means of a trunk, which he describes as containing a present for the emperor, consisting of plate of rare device and jewels of rich and exquisite form. The princess agreed to take them in protection and to keep them near her. In SHAKESPEARE'S time the use of travelling chests on a large scale had not been superseded. Heavy trunks encased in iron bars were carried about, for their size and weight were thought to make the contents sure. In the preceding century WILLIAM CAXTON, in his advice to travellers, had told them to set household stuffs in their "whutche" or cheste, your jewellis in your forcier, that they be not stolen." We have examples which suggest the variations of those treasures at different periods, and we believe it to be an error when English painters in representing the scene in "Cymbeline," beginning with JAMES BARRY, represent IACHIMO'S trunk as an unadorned chest. The chest known as the coffin of St. CUTHBERT suggests the decoration which was popular in England at the time of the seventh century. Mr. ROE tells us that "the coffin is covered with outlined figures of saints and apostles. In the representation of the Blessed VIRGIN and OUR LORD at the foot of the coffin is a most peculiar flow or following of line which should be noticed by the student of archaic sculpture." Although in the thirteenth century massiveness was held to be desirable, yet, according to Mr. ROE, "the bases of the uprights were sometimes ornamented with representations of dragons and other fabulous monsters grotesquely carved, and towards the end of the Early English period and during the following century this decoration was extended and carried up the stiles in successive storeys or compartments." In many instances very plain coffers are described as "Saxon"; the metalwork may present characteristics which belong to a later period, but it is not always to be assumed that the woodwork is of the same date as the lock plates. It by no means follows, however, that all plain examples are necessarily pre-Norman.

The period that can be illustrated by specimens which are to be taken as authentic extends, on Mr. ROE'S showing, from the thirteenth to the first half of the sixteenth century. He believes that there are in England no older coffers bearing any pretence to decorative carving than those in Graveney, Kent; Clymping, Sussex; and Stoke d'Abernon, Surrey. SHAW gave a sketch of the Clymping example in 1836, but since that time "the feet of this coffer with their beautifully indented patterns have disappeared and the lower edge has been embellished with a piece of new moulding nailed on by the village carpenter." A beautiful chest of thirteenth-century work is found at Newport Church, Essex. The lid on the inside is painted with a figure of CHRIST on the Cross, the VIRGIN MARY, St. PETER, St. JOHN and St. PAUL. Mr. ROE is confident that the heads of the Apostles are portraits, the models being probably religious, who belonged to the same monastery as the painter. What is no less interesting is that oil was

\* *Ancient Coffers and Cupboards: their History and Description from the Earliest Times to the Middle of the Sixteenth Century.* By Fred Roe. (London: Methuen & Co.)

used as a vehicle, and it may be regarded as the earliest English specimen remaining. JAN VAN EYCK died in 1440, and his brother, HUBERT, in 1426. While the Newport example exists the brothers must be considered as the improvers rather than the discoverers of oil-painting. Thirteenth-century armoires are particularly rare. The fine specimen in the sacristy of Bayeux Cathedral is illustrated. It is remarkable mainly for its beautiful metalwork. In Noyon is an armoire of which the framing is of oak, while the shutters are of white wood, in order to afford facilities for the painting of figures. In describing the fourteenth-century examples, it is pointed out that changes in architectural details introduced in churches did not immediately affect the wood-carvers. Illustrations are taken from Oxford, Hackonby, Dersingham, Brancepeth, Alnwick, Faversham, Huttoft, Chevington, &c. Some of these chests are of great richness, and denote wonderful dexterity on the part of the artists.

A most interesting chapter relates to "tilting coffers," and it justifies the sub-heading of "A Forgotten Genius." The fourteenth-century examples are truly Gothic, or, in other words, the ornamentation is suggestive of a series of Gothic windows, as if the receptacles were models of churches; but some examples, or rather parts of examples, exist in which architectural lines, such as arches and rose windows, are ignored, and there are instead panels relating to the history of St. GEORGE, tournaments and other knightly scenes. It is supposed they were executed in this country, but the nationality of the artist or artists cannot be traced. The different panels are discussed in detail by Mr. ROE. On some of the features which are common to them all, he writes:—

The tilting coffers, which have been treated in detail, all possess certain features which are absolutely identical. There is a very uncommon sort of chamfer running throughout the series, which appears in the framework of the lids or the trays with which the coffers are fitted. They are all purely secular, not a sign of ecclesiastical tracery or sacred emblems appearing about them, and though slight changes may be noticed in the armour of the knightly figures, they are not more than might have occurred during the course of a very moderate lifetime. It should be interesting to the student of costume to note that the advancement in the armour depicted on the York coffer is supported by a corresponding increase in the fashion of dagging (resembling vandyking), both being a development of those which are shown on the Kensington panel. The undulations of the ground are represented in the York coffer and the Kensington fragment as being burrowed by animals. This does not happen in the other examples, but the treatment is distinctly alike, grass being indicated in every case by a double slit, which is placed perpendicularly at intervals with conventional regularity. It is not intended for a moment to suggest that all specimens of this type extant emanated from one source. A comparison, however, with others that exist will only tend to strengthen the belief that the York, Harty and Ypres coffers, and the Kensington panel, are by the same art-worker.

The fifteenth century favoured the production of coffers and credences in France. The stalls of Amiens Cathedral present a sculptured record of the domestic furniture of that century, and Mr. ROE remarks that "it is said that most of the nineteenth-century counterfeits in which the French are so clever—credences, settles, armoires and the like—are designed by the dealers from these little representations." Collectors of woodwork will find it advantageous to bear in mind the suggestion when purchasing. In the fifteenth century the importation of foreign furniture into this country became so unlimited, it was necessary to pass an Act of Parliament against such manufactures. The French and Germans must have prospered. Flemish work was abundant along the east coast. With so much rivalry it was only to be expected that the native production languished, and consequently "English chests of architectural design are very scarce—cabinets still scarcer; while armoires are to be counted only by units." In the next century the influence of the Renaissance is to be observed, but while that power was exhibited in the woodwork of one part of this country the Gothic spirit was still operating in another part. The characteristics of a style are consequently not invariably a secure clue to the age of specimens.

A special chapter is devoted by Mr. ROE to the

"linen pattern," which appears to have been in favour during the fifteenth and sixteenth centuries. The origin of it has not been ascertained. A capital at Bridlington Priory was apparently suggested by folded linen, and in sepulchral monuments the robes of ecclesiastics and others are arranged in folds which have more or less analogy to the architectural form. Mr. ROE says that the statues were modelled from standing figures, and were then arranged as supine, regardless of the inconsistency. Opinion is in favour of the linen panel being derived from the Flemings, who were excellent linen-weavers. But Mr. ROE maintains that the earliest known examples are French. The form was much in use in France during the reign of LOUIS XI., 1461-83. His conclusion is that "the notion originated in France, the fashion later on being imported into this country, either through Flanders, or direct during the first few years of peace and international commerce in the early part of the reign of HENRY VII." There are more types than are generally assumed, and a great many are described by Mr. ROE. The modern system of producing the folds is unlike the old, for "the perpendicular ridges or folds are run out in lengths by machinery, and the edges finished after the material has been cut up into the desired sizes."

It is gratifying to find so much archaeological enthusiasm shown by a modern painter. Mr. ROE is not satisfied with the collecting of a few types of coffers and cupboards which might be turned to account by himself and his friends in their pictures. He has pursued his subject patiently over a wide field. The primary purpose of his handsome volume no doubt is to gratify amateurs; but the numerous plates will be found suggestive not only by collectors, but by manufacturers of furniture and architects who may have to design woodwork of the different periods investigated by the author.

#### RENAISSANCE HOUSE AT ORLEANS.

THE bizarre house at Orleans shown in the illustration is said to have belonged to a Calvinist named Jean d'Alibert, and to have been the scene (though there is nothing to authenticate it) of a meeting of the Reformed Church on November 15, 1551. It consists of a front 6 metres (about 19 feet 9 inches) wide, built of stone, the courses averaging a foot in height. It is exactly 12 metres high, double its width, from the street level to the top of the cornice, and is divided into three storeys. The arch over the large ground-floor opening is a genuine one—the line of the extrados being marked—and it is consequently elastic, as an arch should be. The same may be said of the smaller archway. But four other circular arches have vertical joints exactly in their centres where the keystone ought to be, and that these openings are narrow—barely 2 feet—is not a sufficient excuse for simulating the round arch form, since an adjoining window of wider dimensions is securely covered by a genuine stone lintel. A certain thickness of wall is maintained up to the first-floor window-sills, but there it has been deemed advisable to "break up" the front, not with the laudable object of economising materials or strengthening some parts and lessening the weight of others, but for the sake of what is called "effect," which consists in this instance of framing the principal window openings with pilasters and entablatures—five of the former on the first, and the same number on the second floor. The pedestals to these pilasters are 2 inches in projection, and bases, shafts and capitals follow in proportion. Above these are architrave, frieze and cornice, but the architrave (the Greek lintel) instead of supporting is supported, and it is therefore excusably divided into several pieces; the frieze which used to tell the history sometimes of the building, sometimes of the builders, is simply a piece of hewn stone, and the cornice, the use of which was to shade and protect the frieze, having in this case nothing to protect, is utilised as a most imperfect window-sill, upon which the rain can stagnate and the dust rest. In a similar manner the upper window lintels are composed of several pieces of stone. Over the architrave of the second order, in the centre of each pilaster, a console is introduced, obviously for the sake of supporting the cornice, but it does so only in appearance, since a space of 2 inches exists between the top of the console and the bottom of the corona.

Above the large arch of the ground floor is a frame evidently destined for the name and calling of possibly the shop-keeper, but the size of the panel is 2 feet 8 inches by 6 inches, and it is 14 feet from the street level, so the letters 4 inches in height would be hardly legible at that distance from the eye. Exactly in the centre of and over this panel is a head 3 inches across the forehead, with two wings of that variety of the

animal creation popularly known as a cherub. The doorway is a tolerable piece of construction, but its ornaments, and those of the window over it, cannot be easily explained. Two heads, male and female, each 4 inches by 3 inches in size, support an order architrave, frieze and cornice complete, supporting two stone troughs placed on end, out of which issue the thighs, abdomens, shoulders and heads of two figures, each measuring 7 inches in height and nearly 4 inches across the shoulders, their arms being lopped off on a level with the bottom of their chests. These figures support another complete order

which serves as an impost to the imitation arches above. On the top is a *motif de sculpture*, consisting of two female figures measuring 6 inches across the shoulders, without arms, and with satyresque extremities, two ribands, two masks, an urn, four acanthus leaves, and a flower of the same plant, a lion's head and mane, and an arrangement of cut cardboard pierced and twisted into volutes. A lion's head, with a ring in the animal's mouth, is placed under two of the pilasters. The sill of the small window on the first floor is supported by three heads, each two inches across the forehead,

HOUSE IN THE PLACE DU MARCHE A LA VOLAILLE, ORLEANS.

and six wings of cherubim. From their mouths fall two garlands, each consisting of one apple, two pears, and sundry smaller fruit of divers kinds. The false arch is crowned by a false order cut in the height of one stone-course, and above the latter are two sitting female figures, measuring seated about 13 inches; an oval medallion, with nothing on its face; a cherub's head, 4 inches in width; and a pair of wings, with a cardboard background.

### HEREFORD CATHEDRAL.

IN June, 1848, a paper was read before the Ecclesiological, late Cambridge Camden Society, by Mr. Haggitt, M.P., which explains the works of restoration then in progress. He said:—The restoration of this venerable church, which has been in progress for about the last seven years, and is even now far from being completed, has attracted less attention than it undoubtedly merits. We propose now to give some account of this interesting work. The most ancient part of the cathedral of St. Ethelbert is supposed to date as far back as 1030. The nave was entirely Romanesque till the fall of the west tower, together with the west front and great part of the clerestory, in the year 1786; after which the west front was restored by the notorious Mr. Wyatt, in that debased style of which he was so perfect a master, and which was yet less debased and less incongruous than the prevailing styles of that day, while the west tower was not rebuilt at all. The lower row of arches, however, in the nave, which are Romanesque, and are really massive and beautiful, still remain. The north and south aisles are early Middle-Pointed. The choir in the lower part is Romanesque, and in the upper First-Pointed. The choir aisles, with the exception of some arches of Romanesque character, are early Middle-Pointed. There are double transepts, of which the south-west is Romanesque, being the most ancient part of the church (some Third-Pointed windows, which have been inserted, being excepted), and the north-west is early Middle-Pointed, having triangular-headed arches and windows. The lady chapel is First-Pointed, and underneath it is a crypt of about the same date. Two Third-Pointed chapels remain, one opening into the lady chapel, and the other into the north choir aisle. The central tower is First-Pointed and very massive; it is supported on four Romanesque arches at the point of intersection of the choir and nave with the principal transepts.

Thus the church is highly interesting to the antiquary, from the number of different styles it contains; whilst to the more devotional mind of the ecclesiologist it will, we trust, when thoroughly renovated, convey that solemn and religious impression, the existence of which is so true a test of the real success of church-building or restoration; nor, we may hope, will the mere careless spectator or thoughtless visitor be able to leave it without some passing feeling of reverence.

The repairs were commenced in 1841, when the dangerous state of the piers which support the tower became apparent. The most remarkable circumstance about their unsound condition was that—unlike most similar cases—it was owing to the fault of Mediæval and not modern builders. A low Romanesque tower had been taken down and replaced about the end of the thirteenth or the beginning of the fourteenth century by a very large and massive First-Pointed tower, built on the same piers. "The consequence was"—we quote from the able statement of the Dean of Hereford—"that no sooner was the tower finished than the pressure upon these piers, composed of a central or internal mass of rubble, constituting the core, and this faced or cased with worked stone called ashlar, soon began to manifest its effects; the weight so compressed the core that it destroyed its cohesion and tenacity, and reduced it in many parts to almost powder, and this being by the weight above thrust against the outward casing caused it to crack and split in every direction, and in various places to bulge out in the most frightful manner." Unwilling or unable to attempt the rebuilding of the whole, those who had the direction of the repairs of the church at that period devoted their energies to keeping up the tower as it was. "They began by drawing from the bottom the old and failing stones, and replaced them with larger pieces of the closest and hardest they could obtain. This was practicable to some little height, but there they found that the enormous weight above them was so doing its destructive work that they were necessarily obliged to adopt a different expedient. . . . The mode which they adopted was this. They formed with much labour and cost stones of about 12 or 14 inches thick in the exterior portion, having in the interior at each end cogs or projections of about a foot cube; then they took out of the old Norman wall stones corresponding in size with these cogs, and thus the weight of the superincumbent masonry tied these in, whilst the stones against the face of the wall counteracted the tendency to bulge. All these stones were cramped in transversely and vertically in different places by lead and iron."

The complete restoration of the tower was a stupendous

task. It took nearly four years, and a cost of about 11,000*l.* has, we believe, been incurred, including the expense of examination, in securing it from falling during the works and completing its repairs. It was necessary to excavate between the piers from north to south on either side of the tower to the depth of 10 feet, and to fill the cavities with concrete. Not only the interior of the base of the tower was strengthened in this manner, but on the south and east sides an area of 32 feet by 23 feet in each was so dealt with, and a somewhat smaller area also on the north side. Another very important cause of the dangerous state of the tower, and of that part of the building which adjoined the lantern, was that some of the arches had been weakened by the mistaken plan of building up within them, with the intention of supporting them. Mechanical principles appear to have been very imperfectly understood at Hereford, or no such grievous piece of folly would ever have been perpetrated. These unsightly and destructive masses of stone and mortar have also been removed. The piers have been restored, and the tower put in thorough repair; and the internal columns of the lantern being now visible form a very striking feature of this part of the building. A ceiling has been introduced, handsomely painted—a proof, we hope, that the whole of the interior decorations are to be executed with becoming richness and magnificence.

In order to convey some idea of the interior of the cathedral, as it will appear when restored according to the plan proposed, we will briefly describe it, beginning from the west end and proceeding onwards to the lady chapel. It is a small cathedral, one of the smallest, we believe, in England. We have before said that the west end of the church was rebuilt by Mr. Wyatt. The door and the window above it are, as might be expected, as inappropriate and as incorrect as anything (except a square-headed door and window of the Grecian style) could well be. On entering the nave, one would be at once struck with the massive beauty of the columns and arches, which are Romanesque, and have not been much injured except by whitewash. The clerestory, however, is Mr. Wyatt's, though somewhat less bad than the west door and window. The nave when completed will contain oak seats for the congregation; and a stone pulpit is to be erected against the north-west pier of the tower. The screen between the nave and choir, which will most probably be placed west of the lantern, is to be of open work. We need not say how highly we approve of this arrangement; the old system of packing the whole congregation into the choir, and leaving the nave empty and almost useless, is so monstrous that one would think it must in the end work out its own reformation; but we are anxious to express our hope that the revived plan of putting the laity in the nave will be fully carried out, and that the choir will be reserved exclusively for the cathedral body, consisting of clergy, lay-clerks and choristers; and that the congregation will be kept entirely to the nave (entering the choir only for the purpose of receiving the Holy Communion) whether a large or small number be assembled.

We make this remark because we believe it has been proposed, and almost fear it is intended, to admit the people into the choir at all times, but to fit up the nave so as to accommodate the greater numbers which may reasonably be expected to be present on Sundays, church festivals, visitations, and other important occasions. The choir is a small one, and will not be too large for the cathedral body (if they attend the services as they ought), and we earnestly hope that the Dean and Chapter will adopt the one right system of church arrangement, and adhere to it steadily and firmly.

The north-west transept is of early Middle-Pointed character, the windows being triangular-headed. It was built towards the beginning of the fourteenth century for the reception of the shrine of St. Thomas de Cantilupe, whose body had previously been interred in the lady chapel, from which it was removed into this transept, where the tomb still stands, though the relics of the saint are no longer beneath it. The transept was used till the commencement of the repairs as a parish church, and has in consequence been much damaged by the cutting through the columns to receive the timbers of the galleries and stopping in the fissures so cut with brickwork, by attaching mural tablets to the walls, and by the rest of the modern fittings. It is to be thoroughly repaired, and the arches and windows (now in an unsafe state) to be made secure, and the whitewash to be cleaned off. The south-west transept is (with the exception of some arches in the choir aisles of about the same date) the most ancient part of the cathedral. It is a fine piece of Romanesque work. In its east wall is a large fissure, which will of course render a careful repair of the wall necessary. The west wall has, like the east, been very much injured by the erection of mural tablets against it, and it is now in an unsound state. There are an ancient fireplace and aumbry in this wall, which are to be restored. Some Third-Pointed windows have been inserted in the transept.

The entrance to the choir is to be "by gates of wrought metal, forming part of an open screen of metalwork."

Formerly there was a stone wall separating the choir and nave, and the organ was placed upon it. Of course the new arrangement is infinitely preferable; the organ will be placed on the side, probably in the north transept. The choir will contain all the proper fittings. The ancient carved oak stalls and throne are to be repaired; and we find among the various items the following:—"A new communion table of suitable and approved character, according to design, to be placed at the east end;" and again, "A rich covering for communion table." Now we really trust that this, translated into Catholic phraseology, means an appropriate altar suitably vested. The steps are to be of Purbeck marble polished. There was formerly a horribly ugly Grecian screen at the east end of the choir, and above it a debased window, filled with painted glass, representing the Last Supper, the offspring of private munificence (unhappily misapplied, for the painted glass was very bad). This has all been removed. A noble Romanesque arch now forms the eastern extremity of the choir, and above it has been inserted a triple window, enriched with the tooth ornament and beautiful in detail, which will be filled with stained glass. We hope an appropriate reredos will be placed behind the altar. In a drawing which came out a few years ago, the only reredos was a sort of open arcade; but this design, we are glad to find, is to be altered, and a proper one erected.

The Dean of Hereford informs us that very lately there have been discovered some traces of three apsidal terminations to the choir and choir-aisles of the Romanesque church before the building of the present lady chapel.

The north-east transept contains some debased windows, and therefore is not one of the most beautiful parts of the church. This also is to be duly restored, as is the ambulatory between the choir, lady chapel and transepts. In the south-east transept some modern windows are to be taken out and reinstated in stonework.

The lady chapel is a well-known specimen of First-Pointed architecture. It had been used previously to the commencement of the repairs as a library, but will, we hope, when completed be duly fitted up with an altar, and used for such services of the church as may be more properly and conveniently performed in it than in the choir, such as early communions, early morning or late evening prayers.

There are five beautiful lancet windows at the east end, which are to be filled with rich stained glass of design in character with the date of the chapel; a handsome wheel-window above these has also been restored. The roof has been raised. We trust the lady chapel will be restored in full accordance with the remaining traces of its ancient beauty. There is a small Third-Pointed chapel opening into it on the south side, supposed to have been commenced by Bishop Audley about 1495, and probably completed by his successor. It contains together with the stone screen, which separates it from the lady chapel, some ancient painting. Some remains also of figures painted over some of the tombs are visible. A double piscina has been beautifully restored.

We are sorry to see the ceiling, both in the choir and lady chapel, instead of being richly painted, covered with cement jointed so as to imitate stone, and coloured so as to imitate particularly that reddish stone which has been used for most of the repairs. This, of course, we dislike, because we abhor all imitations, whether of a good, bad, or indifferent character, and we think they are contrary to the principles of all good taste. In a church, however, they are especially objectionable, and accord but little with the stern reality of that religion which churches should symbolise. This is undoubtedly a good imitation, but that circumstance does not remove the objection to it; besides which, we do not think that even real stonework, left bare and unornamented, would be the best way of finishing the roof. We hope, then, that this defect may be at some future time corrected.

There are some encaustic tiles at the east end of the lady chapel; these are to be relaid and made good, where defective, with tiles of corresponding design; and the whole of the chapel will be paved with new tiles, as will also the ante-chapel (from which there is to be a flight of stone steps leading up to the lady chapel); and, if we understand rightly, the whole of the cathedral is to be similarly paved, the tiles in the choir being, of course, of a richer character. We hope that in the sacristy, at least, they will be coloured.

The crypt, which is under the lady chapel and communicates with it by steps, is an ancient one. It contains in the middle a tomb, with the figures of a man and woman engraved on it, the date being 1497. We are not aware that anything is to be done to the crypt. Having mentioned the subject of tombs, we may add that in this, as in most old churches, there are many beautiful monuments, effigies of bishops and other churchmen of the Mediaeval times, presenting that striking contrast to the semi-heathen designs so prevalent in modern days, which contrast, remarkable as it is in all the various details of ecclesiastical art, is nowhere more so than in comparing the different kinds of memorials which the past and present ages have assigned to the departed.

The exterior of the roof of the choir and lady chapel has been newly covered with lead, and along the ridge of it runs a metal crest with the inscription "Laudate Dominum." There is a handsome, though much too heavy, gable cross at the east end. The lady chapel, viewed from the exterior, appears half detached from the rest of the church, part of the building connecting it being a good deal lower than the chapel itself. At the eastern gable of the choir a beautiful and massive cross has been erected, under which, and opening into the space between the roof and inner ceiling, is a trefoiled window, and a little below it, on either side, a panel cross has been very well carved on the wall. Under these again appears the triple window before mentioned. Two pinnacles of rather elaborate design complete this gable.

With the exception, however, of the view of the east end of the choir and lady chapel, the exterior appearance of the cathedral is less pleasing than that of the interior of the building. The incongruity of the various parts forces itself strongly on our notice, and the west end is (it would seem) irremediably spoilt; but the huge tower forms a very beautiful and imposing feature.

One sad drawback to the restoration exists—the want of funds. Above 20,000*l.* have been subscribed or promised; but at least 12,000*l.* more are requisite for the completion of the work; and it is to be hoped that the liberality of zealous churchmen will be directed to this object. It deserves their attention, for an attempt is here being made to revive the true church arrangement and a due celebration of the Holy Services; and it is to the success (under the blessing of Providence) of endeavours of this kind in places so well fitted for them as our ancient cathedrals, that we must look for the recovery of so many who have wandered from the path of obedience. Only let this and all cathedrals be more thoroughly adapted to the wants of the people, by throwing open to all alike the advantages of increased accommodation for worshippers, and by bringing home to their hearts all-important truths and all-important practices of devotion, through the medium of their constant services and solemn ceremonies—and, we may add, by the noblest application of the most sublime of the arts, sound ecclesiastical music (eminently fitted as this much despised and neglected style of music is for devout worship)—and we may then trust that the Church will be again, as in bygone ages, loved and obeyed by all, to the discomfiture of heresy whether existing within or without her pale.

#### MEMORIAL TO QUEEN VICTORIA.

THE memorial to Queen Victoria in St. Mildred's Church, Whippingham, Isle of Wight, which is being erected as a tribute of affection by the King and Queen and other members of the Royal family, and with which the German Emperor has personally associated himself, is now approaching completion. It takes the form of a reredos with ornamental panels, and the decoration of the chancel generally. This beautiful work has been carried out from designs and under the superintendence of Mr. A. Nutt, the architect who designed the Coronation annexe for Westminster Abbey. The distinctive feature of the reredos, which has been worked in alabaster, is a central panel depicting the Last Supper, all the figures in which are wrought of the purest white marble. On either side is a miniature panel, the one denoting the sacred emblems of the Bread and the other the Wine, represented by wheat ears in white marble, and a bunch of grapes, also in white marble. There are two larger panels representing the Alpha, with the words, "Holy, holy, Lord God Almighty," and the other the Omega, with the inscription, "Heaven and earth are full of Thy glory." The steps approaching the altar are of Belgian granite. A figure of the patron saint of the church of St. Mildred in embossed stone fills a niche at the side of the reredos, and on the corresponding side is a figure of St. Catherine. The effect in each case is enhanced by the introduction of tiny red marble shafts or pillars. On either side the new oaken roof above the sanctuary are figures of three angels representing the heavenly host, artistically produced in gilt and Oriental colouring, each bearing a scroll, whilst conspicuously near is the appropriate inscription, "Holy, holy, holy." A new stall, with oak tracery doors, has been placed opposite the Battenberg memorial chapel in the chancel. In former days this stall was occasionally used by the late Queen Victoria and other members of the Royal family when the Court was in residence at Osborne.

A New Church dedicated to St. Mary and All Saints, which has been erected for the Palfrey district at Walsall at a cost of about 6,285*l.*, was consecrated on the 13th inst. The new building, which will accommodate about 700 people, has been erected by Mr. W. Hopkins (Birmingham) from the plans of Messrs. Cutts (London).

## NOTES AND COMMENTS.

A GREAT many of the older churches of Europe possess objects of which the history is not easily traced. In some cases they have been found in the course of time to possess historic interest. The Elizabethan stoup which was discovered in 1862 under the pulpit of Malling Church, Kent, has no doubt a history, although at present there is no clue to the original ownership or how or why it found its way to the church. It is of Delft ware, stands about 10 inches high, and is decorated with figures that may represent heathen beings, but are without Christian symbolism. It bears the date of 1581, and therefore belongs to the reign of Queen ELIZABETH. At that period there was occasionally indifference about the character of the vessels used in church services, and the stoup of pottery might be deemed as becoming as any vessel of silver. All that can be stated about it is that it was never used since 1780. In Malling Church it is only a curiosity, but a collector has offered 500*l.* for the jug. There is always need for money to carry out improvements, and the parish of Malling is no exception. A Consistory Court was held on Saturday at which the vicar and churchwardens applied for a faculty to dispose of the stoup. The only opposition was by Mr. PAINE, the secretary of the Kent Archæological Society, who argued that such objects ought not to be allowed to be withdrawn from the parish or church to which they belong. Earl STANHOPE, who is president of the Society, wrote a letter expressing approval of the sale, and which therefore demonstrated that archæologists were divided on the question. Dr. TRISTRAM granted the faculty for the sale, and said the objection to parting with such articles in order to pay for improvements could not now hold good.

THE Ordnance Survey is national property, and accordingly a general use of the sheets is advantageous. There is uniformity, and, all things considered, the correctness of the maps is remarkable. Surveyors have some reason to grumble when they find the maps are preferred to special surveys, but they have to admit that they cannot compete in price with Ordnance work, and in the present condition of the estate market economy, even in mapping, cannot be neglected. The question of copyright is, however, imagined to affect the reproduction of the maps. It is common to see exact copies of particular districts in local guide-books. But in such cases it is supposed the public tacitly insist on faithful copies of the maps. When maps are employed by auctioneers as illustrations of their particulars of sale, it is believed by some that only the interests of individuals are served, and there has been much misgiving whether the direct reproduction is not a breach of copyright. Some correspondence has been carried on between the Auctioneers' Institute and the Stationery Office on the matter. It has been at last conceded by the authorities that henceforth it will not be necessary to make an application in every instance when an auctioneer desires to reproduce a part of the Survey, but the following conditions will have to be observed:—(1) That the source from which any reproduction is taken is duly acknowledged on the face of each copy in the following terms:—"Reproduced from the Ordnance Survey Map with the sanction of the Controller of H.M. Stationery Office." (2) That the map as reproduced is not placed on sale, but is only used for the purpose of particulars of land sales. (3) That a copy of the map as reproduced is in every case forwarded to the Director-General, Ordnance Survey, Southampton, and that another copy will, if demanded, be forwarded to the Board of Agriculture, 4 Whitehall Place, London, S.W.

WESTMINSTER ABBEY is no doubt a church of England subject to the laws in common with other churches, but it must also be treated as our grandest historical memorial. It would have been a great advantage if the German example were followed and the building allowed to remain in its pre-Reformation state. We suppose it is too late now to expect a general acceptance of that mode of treatment, and on that account Lord KINNAIRD was justified in asking why a stone altar and a crucifix, together with two figures of saints, were removed from another place and set up at the shrine of EDWARD THE CONFESSOR. In such a case the Dean and Chapter are responsible, and the Office of Works could not interfere. Indeed, it might easily be

inferred from the recent ceremonies the peculiar position in which Westminster Abbey is placed. The Lord Chancellor was able to point out that in the Abbey, as in less important churches, three male persons of full age could complain to the Bishop about any new ornament introduced, and the Public Worship Act would then be set in motion. Probably nobody who was not strongly moved by the love of self-advertising would venture on the course indicated by the Lord Chancellor. There is no doubt the scenic effect of the Abbey as a Mediaeval building is enhanced by accessories like those complained of, and the time is past when they could be condemned as aids to idolatry.

In several quarters of Paris there are shopkeepers who make it a rule to respect Sunday by the closing of their premises. Although the greater part of a street may recall on those occasions the streets of London, men are generally at work either on the erection of new buildings, reparations or street works, such as altering the roadway. Repetitions of the same scene compel the visitor to come to the conclusion that for anyone engaged in construction there is no respite. No men work harder than those belonging to the building trades, and it seems extraordinary that they should be so severely treated. There are several reasons for the perpetual toil. Many of the workmen belong to the provinces; they are employed in Paris only for a few months, after which they return. They consequently wish to earn as much money as they can in a short time, and they console themselves with the reflection that in the dead season there will be Sundays enough to repose in. Then there are many improvident workmen who would be opposed to any cessation of labour. On the other hand, there are numerous contractors and men who would gladly see a better arrangement of the week. That spirit has been strong enough to have the subject discussed at great length at the Builders' Congress which has just been held in Paris. Reports are to be prepared on the question, but the ordinary contractor will be unable to allow his men a respite from labour so long as the State and the municipality insist on regarding all the days of the week as alike.

THE island of Thera in the Grecian Archipelago is somewhat barren, owing to the prevalence of pumice stone, and the effect is increased by the number of dwellings which are cut out of the rock, and might therefore be regarded as cave-dwellings. But the island has some archæological importance. The Phœnicians owned it at one period, and wherever they settled there is a likelihood of discovering examples of primitive art. It was also connected for a time with Sparta. However, the dreariness of the island deterred archæologists until the German explorer HILLER VON GAERTRINGEN, in the summer of this year, undertook the task of investigating the chief town. He ascertained that the Byzantine church has been erected mainly with antique masonry. From inscriptions, it is evident that the stones were derived partly from a marketplace and partly from a temple dedicated to BACCHUS. The explorer, being anxious to perform the work systematically, has endeavoured to make a plan of the town. This has been an exceedingly onerous undertaking, owing to the number of wretched dwellings which occupy the sites of the ancient houses. An immense number of inscriptions have been met with, some of them in positions to which it was difficult to climb. All the remains discovered by Herr HILLER VON GAERTRINGEN have been deposited in an improvised building which serves as a museum.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. Aston Webb, A.R.A., president, in the chair.

Dr. A. J. EVANS read a paper entitled

## A Bird's-eye View of the Minóan Palace of Knossos, Crete.

He said that after three campaigns of excavation, begun in 1900, it was now possible to speak with some confidence of the main lines of the great prehistoric palace that it had been his lot to bring to light on the site of Knossos. The magnitude of the work could be judged from the fact that between four and five acres of the building had now been uncovered, and in some parts the area had been practically doubled, so far as architectural results were concerned, by the recovery of extensive remains of upper storeys. Great assistance had been given to him through the Cretan Exploration Fund, and he gladly seized the occasion of heartily thanking the Institute for its liberal contribution; but the annual amount to be covered, over and above the assistance given, had still been necessarily large. In carrying out the work he had been specially fortunate in securing the services of Dr. Duncan Mackenzie and of Mr. Theodore Fyfe, as to the excellence of whose architectural plans and drawings the Institute had that evening an opportunity of judging.

Reviewing the construction of the palace and its general design and distribution, Dr. Evans stated that in outline the palace very nearly approached a square form with an oblong central court and apparently four main entrances roughly answering to the points of the compass. To the west were the remains of a paved court with altar bases and raised causeways. Along the base of the palace wall was a raised plinth which seemed also to have been used as a seat, and there was every indication that this was the principal gathering-place of the people—the Agora—where king and citizens would most naturally have met. Here was the state entrance, a lofty porch flanked by fresco paintings of which bulls formed a principal feature, and giving access to two imposing entrances. One of these opened into a magnificent corridor, the other to a chamber at whose portal one might well believe the king sat in judgment before the assembled people in the Agora beyond.

The entrance corridor contained remains of a great processional fresco—men in long robes, priests or princes, youths carrying vases, apparently tribute-bearers, the lower borders of the robes of a brilliantly-apparelled lady, perhaps a queen. Evidence was forthcoming of the continuation of this "Corridor of the Procession" along the upper terrace of the southern face of the palace. By this means a covered line of passage was secured between the state entrance on the west and the eastern quarter of the palace, passing the southern entrance, and looking out on the south end of the central court.

The more immediate objective of the entrance corridor from the west was to be found in the remains of a propylæum overlooking the southern terrace. This propylæum was originally entered by three doorways, giving access to a kind of fore-hall containing two column bases.

The same system of processional figures that characterised the walls of the entrance corridor from the west was continued on those of the columnar hall. The elegant pose of the youth bending back to support the weight of the tall painted silver vase that he bears with both hands, the brilliantly decorated belt and embroidered loin-clothing, but above all his finely cut features, of a dark South European type not yet extinct in Crete, combine to stamp this as the finest example of figure painting that had survived from prehistoric Greece. Two remarkable fragments show a part of a head, with a fleur-de-lis crown, and a male torso, naturalistically moulded, wearing a fleur-de-lis collar.

This southern propylæum gives access to a small court with an altar-base, beyond which, in the present state of the remains, was visible a somewhat complicated block of small rooms. Many of them seemed to have served as the offices of palace functionaries, and contained deposits of their clay archives, accounts, and other documents in a highly developed system of writing about a thousand years earlier than the first written records of historic Greece. Other small chambers were used as stores for fine stone vases, or as cellars containing vats and tall jars, once filled with oil or wine. This block of ground-floor or basement rooms flanked the west side of the central court, the floor level being four steps down from it. On its inner or western side the block was flanked by a fine paved corridor, upon which opened a succession of eighteen magazines, many of them with their rows of huge oil jars—large enough to have accommodated the forty thieves—still ranged in order against their walls. Beneath the paved floor on which rested the jars were double tiers of stone chests, lined with lead, which may have been constructed with a view to securing treasure.

The existing remains of upper blocks show that the whole of this region was originally surmounted by a more important

upper storey. The distribution of these upper blocks, as well as the inner lines of the lower walls and supporting pillars in the central part of this area, show that an important hall ran down it, the general outline of which can, to a great extent, be recovered. It almost exactly corresponds in arrangement with the great Megaron of the contemporary palace excavated by the Italian Mission at Phaistos, on the southern side of Crete. The face of this hall rose opposite the propylæum, and it was approached either by a ramp or, as at Phaistos, by a flight of steps that has since disappeared—this particular portion of the site having been much denuded.

A most interesting room in this part of the palace was the room of the throne, discovered—though at but a small depth from the surface of the ground—in a surprising state of preservation. The remains of the frescoes, wingless griffins with peacock plumes against a landscape background of somewhat Nilotic aspect, were still clinging to the wall. Gypsum benches were ranged on three sides round the well-paved floor, which still showed traces of its central square of red-painted plaster. In the centre of the north wall, between two lower benches, rose the gypsum throne with its high leaf-shaped back—it was once covered with coloured designs—its shapely seat, its lower arches and crocketed moulding, so strangely anticipative of Gothic architecture. Opposite, giving light to the whole, was an impluvium, except for the inverted lines of its supporting columns, almost Pompeian in character, with steps descending to an oblong basin beneath the light well, which may have served as a shallow bath. The wooden columns were found in their sockets in a carbonised condition, but together with the upper part of the walls and the roof they had now, in accordance with Dr. Evans's directions, been restored by Mr. Fyfe after a wall-painting of a small shrine found in the palace, so that this little gem of Knossian architecture has been definitely rescued from destruction.

Of the importance of the great Megaron, and its magnificent decoration, the contents of the basement spaces bear ample witness. Here were found not only pieces of bull reliefs analogous to those from the northern entrance, but remains of painted human figures, both male and female, moulded in high relief in gesso duro, and showing in their reproduction not only of the general contour, but of the individual muscles, sinews and veins, an extraordinary fidelity to nature. Fragmentary as they are, they represent the highest achievement of stucco relief by the Minóan artists, and found their fitting place in the largest palace hall.

Having given a description of the "Hall of the Colonnades," one of the finest features of the building, and the staircase—flights of stairs, in one case flanked by a balustrade, leading from one storey to another—a discovery, Dr. Evans considered, probably unparalleled in the history of excavation, the author next treated of what was obviously the domestic quarter. The centre of interest here was a very original chamber, called by the author the "Queen's Megaron," which was approached through double doorways by a crooked passage from the "Hall of the Double Axes."\* It was divided into two parts by a stylobate, with pillars at intervals on a central ledge, leaving ample openings for light, and which showed on each side of it remains of a shapely bench of wood and plaster.

A small private staircase leads up by two flights of stone steps from the Queen's Megaron to the chambers, still partly traceable above this room and the adjoining hall of the double axes. There are indications that this staircase was continued to a still higher storey. On the west an upper and lower passage leads to a complicated series of rooms originally provided on one side with a wooden staircase, which seem to have been used as sleeping-rooms and for other domestic purposes. There is here a small court suggestively marked with the distaff sign; an inner room where valuables seem to have been stored, of which various traces, including a gold heart and parts of a crystal bowl, were found, and other rooms which may have served as bedrooms, including one off which opens the nearest approach to a modern water-closet yet found in any ancient site. There is here, besides the passage to the main drain, an actual flush-pipe and there are traces of a wooden seat.

Nothing, indeed, is more extraordinary than the remains of an elaborate drainage system existing throughout all this section. The limestone slabs of sections of the pavement, the pillar bases and door jambs, walls with painted stucco still adhering to them—in one case even a stone bench in position—are here preserved on the upper-storey level. From these floors a succession of stone shafts—one apparently connected with another latrine—descend to a network of stone ducts, large enough for a man to make his way along them, beneath the floor-level below. It may be added that near the olive press area were found fine terra-cotta drain-pipes fitted into each other with stop-ridges and internal collars to grip the

\* One of the largest existing halls of the palace, and named from the signs repeated on its limestone blocks.

cement, which in some respects seem to equal the most modern forms, though following out a different principle.

Very animated paintings representing scenes from the bull-ring, in some of which female toreadors took part, formed a favourite subject of the palace wall-paintings. The room above the "Queen's Megaron" seems to have been adorned with miniature designs of this class.

Dealing with the general design and construction of the building, Dr. Evans brought out some remarkable contrasts presented by the palace of Knossos when compared with the palaces of Tiryns and Mycenæ, showing that in the former, unlike the Mycenaean palaces, everything was arranged according to the most elaborate planning, the whole outline being laid down in definite lines without regard to the site—or, rather, a site seemed to have been chosen which allowed free scope of action to architect and engineer.

Another point dwelt on was the striking resemblance in plan between the Knossos building and the palace of Phæstos—among known buildings the only real parallel. Summing up, Dr. Evans said that it was impossible, in view of the fundamental arrangement revealed by those buildings—pointing in both cases to a more or less square building with central court crossed at right angles by two main lines of approach—not to recall the familiar features of the Roman camp, and its still more remote prototype as traced by Chierici and Pigorini in the prehistoric pile-settlement, the "Terremare" of the Po Valley. The quadrilateral form, the orientation, the existence of *Cardo* and *Decumanus* and their parallel lines, and the inner court itself were points of comparison of a very suggestive kind, and seemed to point to an ancient European system of arrangement, sister forms of which were preserved by prehistoric Crete as well as Italy.

The palaces of Knossos and of Phæstos belonged in their existing shape approximately to the same period. That period, as shown by the earliest remains of vases and other relics found above the floor-levels in each case, was somewhat more remote than that to which Mycenæ has given a name, though in both cases modifications of the building were carried out during the Mycenaean period proper. The best positive chronological data is supplied by the lid of an Egyptian alabastron found with remains of indigenous stone vases belonging to the Early Palace period on a floor-level near the northern hall. The lid has a beautifully cut cartouche of King Khyan, of the fifteenth dynasty, who was the principal ruler of the foreign or Hyksos conquerors in the Nile Valley. He seems to have reigned about the eighteenth century B.C., and, considering the rarity of his monuments in Egypt itself, it is difficult to suppose that objects with the name of this Pharaoh could have reached Crete at a later date.

The high level of civilisation reached in Minôan Knossos by the date of the foundation of the existing palace, so conspicuous alike in its architecture and decoration, points itself to long centuries of earlier development. It is not surprising, therefore, to find beneath the later foundations the remains of a still earlier palace, the lines of which seem partly to have been followed in the later work. The thirteenth dynasty monuments—not later than 2100 B.C.—found beneath the pavement of the central court, seem to belong to this earlier building, and a series of exquisite painted vases of eggshell fabric, in design and colouring never certainly surpassed, point, together with other relics, to an intimate acquaintance with twelfth dynasty designs, going back therefore to about 2800 B.C. But beyond this, again, we have evidence of still earlier princely occupation, and fragments of imported Egyptian vases of diorite and obsidian that take us well back into the fourth millennium before our era. And still before this, underlying the whole hilltop on which the palace stands, is a vast Neolithic settlement replete with stone weapons and implements, of primitive pottery and idols, as were later supplied by ancient intercourse with Egypt, which carries back the antiquity of the site beyond the limits of such records.

Mr. W. E. F. MACMILLAN, who proposed a vote of thanks to Dr. Evans for his paper, said he had been told that the Institute concerned itself more with architecture than with archaeology, but on listening to the paper, illustrated by the drawings of Mr. Fyfe, he thought they would all agree that the problems raised in the Knossos Palace excavations were largely architectural. There was, however, still much left for archaeologists as well as architects to do. The work of excavating would continue for another season, but as yet they lacked the necessary funds to carry it out.

Mr. R. PHENE SPIERS seconded the motion. He said it appeared to him from the specimens of work shown them on the screen that the further back they went in the date the purer and finer seemed the examples of art, as with the earlier Egyptian tombs in their decoration. The plan of the temple of Knossos was very interesting, and he thought that if seen alone and without any information it might be taken as the result of excavations in Rome, and would have passed as the palace of the Cæsars. It was probable that the upper walls, being largely composed of rubble with clay, when they fell down

helped to preserve the lower portions of the building and the frescoes.

Mr. THEODORE FYFE explained the slides shown on the screen from his drawings of some of the stucco fragments.

Mr. D. J. HOGARTH supported the vote of thanks.

Dr. EVANS, in briefly replying, expressed his indebtedness to Mr. Fyfe for his skilful work on the site of Knossos. In view of the interest taken in the work the Council of the Royal Academy had consented to allow an exhibition of the drawings, plans and some casts at their winter exhibition, so that those who wished could examine the details at their leisure.

## CLAVERLEY CHURCH.

A PAPER was lately read before the Archaeological Institute by Mr. Philip M. Johnston, architect, upon some late twelfth-century paintings recently discovered in the church of All Saints, Claverley, Shropshire. The church, which lies about seven miles east of Bridgnorth, owes its foundation or rebuilding to Earl Roger de Montgomery, who was constable of the Castle of Bridgnorth. He commanded the mercenaries of the Conqueror's army at Senlac, and was rewarded with large estates in Shropshire and other counties. It is recorded that he and his countess built a church in Quatford in honour of our Lord Jesus Christ and St. Mary Magdalen and all the saints of God, and that they endowed their foundation of six canons with certain lands and churches, Claverley Church among others, the vicar of Claverley being appointed dean of the chapter. Some traces of the eleventh-century church are to be seen in walls and string-courses in the interior of the nave. It was an aisleless building, probably terminating in an apse. The aisle on the north of the nave and a tower on its south side were added about 1140 and 1170 respectively, while the south aisle, the choir and its chapels and other features belong to various dates from the thirteenth to the fifteenth century. The paintings which formed the subject of the paper were brought to light during the restoration in the early part of the present year. They are of unique interest on account of their exceptionally early date (c. 1170) and the principal subject represented. This is nothing more nor less than an incident in the battle of Senlac. Parts of the same scheme of paintings occur on the internal walls of the tower and round the pointed arch by which it opens to the nave; but the most prominent portion is a strip, about 40 feet long by 5 feet broad, above the north arcade of the nave. On this are depicted thirteen horses and their riders, engaged for the most part *vis-à-vis* in pairs, some armed with swords, but the majority with lances. Their horses are coloured red, yellow, pink and white, with green dappling. The costumes of the figures present a general resemblance to those of the Bayeux tapestry, and, after allowing for the interval of time between the two works, they are remarkably alike in treatment. The knights wear masled armour, similar to that which appears, with other varieties, in the tapestry. Their mail shirts are combined with leg-coverings as far as the knees, and leggings of similar character appear below. Over their armour they have surcoats of the kind that came into fashion in the latter part of the twelfth century, and they mostly wear the flat-topped helmet with barred and grated vizor that we find on the seals of Richard I. Another mark of date appears in the kite-shaped shields of the modified shape in use in the second half of the twelfth century; while the horse trappings and saddles of quilted leather all point to the same period. At intervals between the combatants are conventional trees, curiously reminiscent of those in the tapestry. In the centre of this strip a knight is shown unhorsing his opponent, the latter being represented as a gigantic figure tumbling on his head, with his legs in the air. This incident, evidently intended as the motif of the painting, suggested to the vicar of Claverley (Rev. T. W. Harvey) a clue to the meaning of the whole, viz. that the painting is a pictorial representation of the personal encounter recorded in the "Roman de Rou" between Roger de Montgomery and a gigantic Englishman, captain of 100 men. If this be the true explanation of this remarkable painting it possesses an interest that can only be described as unique. To account for its existence upon the walls of this church it must be remembered that Earl Roger was the builder of the church and the founder of the chapter of canons associated with it, and also that by the ruling caste and their clergy the Norman Conquest had been invested with a semi-religious halo; it had not only been solemnly blessed by the Pope, but had received the sanction of success. The other paintings in the spandrels of the arcade and elsewhere are of a more ordinary character—incidents in the lives of saints, the torments of hell, figures of the seraphim, &c. The borderings throughout are of a very elaborate character, red, yellow and pink being the colours principally used. Mr. Johnston, who exhibited full-size cartoons of the principal subject, coloured to represent the original, described the steps that had been taken for the preservation of the

paintings, and mentioned that he was preparing a careful copy, to be mounted upon a roller and deposited in some accessible place for reference.

### ARBROATH ABBEY.

BY the demolition of the north-west tower of Arbroath Abbey, which the stress of time and tempest seems to have rendered inevitable, this magnificent ruin will lose one of its striking architectural adornments and the ancient burgh a landmark that unites it with the ages. Immortalised in fiction and conspicuous in the realm of history, the abbey of Aberbrothock, says Mr. P. C. Carragher in the *Scotsman*, is endowed with a superb charm which clings to every vestige of its picturesque fabric, each stone and column, gloomy crypt and graven corbel contributing a chapter to the wonderful romance that legend and annal, poetic fervour and fond fancy have elaborated.

The tower of the monastery of St. Thomas à Becket, as the loftiest part of the existing ruins, thus commands an interest of its own—one which will, it is believed, survive as long as the ruins endure or a single part is left to mark the foundations of this great stone colossus. The imposing character of this remain helps us to judge of the importance of the abbey itself, over which so many historians have grown eloquent, whose praises so many poets have chanted, and around which, by its palpable reproduction in the pages of "The Antiquary," Scotland's greatest novelist has woven a magic spell.

The towers of Aberbrothock Abbey (there were several) must have been of exceptional magnificence, for they are so described in the evidence of Sir Arthur Bone, priest of Brechin, as contained within the "Vetera Monumenta," wherein the church is described as of Early English architecture and of the First-Pointed style of Gothic, and is also stated to be nearly twice the size of Sta. Maria del Popolo, which it closely resembled; this being partially accounted for by its joint dedication to "Mary the Virgin" and "St. Thomas the Martyr." The tower now crumbling into decay, which was 103 feet in height, is described in 1517 as somewhat higher than the campanile of Sta. Peter's at Rome, and as containing "many excellent bells." The standing relic disposes of any doubt as to the prominence it occupied in the abbey's design, and this great red column (for centuries a guide to the mariner on the North Sea) rises high in air like some gigantic stalk, dignifying rather than dwarfing the broken structures which are so artistically clustered at its base. Nor is this altitude in any way disproportionate to the character and extent of a building which Ochterlony assures us was "the largest for length and breadth in Scotland," which we know rivalled in size and splendour the great church of Dunfermline, the monastic houses of Chester and Lichfield, to which its redstone composite bore some resemblance, and Holyrood, which vied only with it in richness of endowment. But if, failing the magnitude of St. Thomas's Tower, proof of the extent and elegance of the abbey were wanting, it would be furnished in the still standing sanctuary and high altar, the former scene of its impressive services and high pontifical ritual, and in the also surviving lofty tribune of St. Catherine's altar, clothed from the great ellipsis ("the round O") to its base with a wealth of carving and balconied sculpture, the original beauty of which it requires no strain of the artistic imagination to conceive.

Although hundreds of years have sped, there is an impress of reality in every uninjured niche and shadowy corner of those aged walls. Stairways and porches give back the shadows of the ghostly figures which flitted hither and thither along those now silent colonnades and passages. The original sacristy, surrounded on all sides by an arcaded dressing of arches, is so entire that one almost expects to see emerging from the vaulted doorway the procession of ecclesiastics and acolytes with clasped hands, upraised croziers and swinging censers. We can to-day walk around the broad walls and look down into the gardens, still suggestive of cloistered peacefulness and the grey cassocked figures which haunted them. We can see—also in its perfect entirety—the abbot's house (the only one in Scotland), which sheltered its thirty-two mitred celebrities, beginning with that humble monk of Kelso who was elevated to its first pastoral dignity, embracing in the long succession Bernard de Linton, high priest of the Scottish forces at Bannockburn, and ending with Cardinal Beaton, the most illustrious and last of its robed prelates. Here De Linton entertained the Bruce, and the King of the Commons cracked his jokes. This was the temporary home of celebrities royal, ecclesiastical and literary. Of the last category were Alexander Myln, first president of the Court of Session, and John Barbour, father of Scottish poetry.

In all this wealth of reminiscence and royal interest, the abbey's surviving fabrics share, and it is when we come to examine the fine entrance and its ornaments that we realise how splendidly the approach to this headquarters of Church ordinance and royal convocation was dignified.

Here, standing as it did centuries ago, is the Galilee porch with its deep recesses and entrance arch—abounding in the triumphs of carving art, and the broken curve of the beautiful rose window presents a faint suggestion of that which in Durham Cathedral commands the admiration of the sightseer. If the tower of St. Thomas, upon which the unalterable fiat of the Commissioners of Woods and Forests has now fallen, is the feature of the existing ruins, how conspicuously must it add to the sombre dignity of the abbey front. Upon it the builders of the abbey seem to have lavished much skill, destined as it must have been to outlive the centuries. The inner stairway—which few of the later generations have ever had the pleasure of climbing—gave partial access to the choir, the Gothic openings of which remain to remind the visitor of those grand orisons that floated over its ornate balcony towards the high altar then wreathed in the incense of solemn mass and crowded with gorgeously-vestured priests—a place, indeed, of picturesque ceremonial, Mediæval grouping and divine song.

From the tower the clangour of fine bells awoke the distant echoes of the valley of the Brothock, at matins, vespers, sexe and none, and ringing out to ocean, reminded the mariner of that good abbot of Aberbrothock, upon whom Southey's cherished legend confers the title of a truly practical benevolence—the hanging of a bell for the warning of sailors on the classic Inchcape Rock.

The tower seems to have overshadowed in interest everything of its kind. It obviously commanded a wide prospect, and imagination can readily conjure the vision of those grey-coated Tyronensian monastics peering into the vista, and falling into ecstatic raptures as glittering spear and flashing coat of mail announced the approach of a royal retinue; for Arbroath Abbey is rich to overflowing in the memories of its kingly pageantries, from the days when its worthy founder, William the Lion, came to witness his accomplished work, down to the time when the over-zealous Queen of Scots—the last royal visitor to the abbey—laid her troubled head within its hospitable roof. At the present day, when it is fashionable to attribute to pestilence and the ravages of storm and age rather than to the destructive tendencies of individuals the decay of our ancient monuments, it looks like a contradiction in fact to find that so early as 1580 Arbroath Abbey was permitted to be used as a quarry to build the parish church. In the seventeenth century it was further seized upon by the local magistrates to build a Tolbooth, the predatory instinct of the townspeople following that earlier example in vandalism and the lead of the burgh magnates to the more audacious extent of taking stones to build their own dwelling-places, thus making a veritable quarry of a sanctuary. When Dr. Johnson came to view the ruins of the abbey in August 1773 and paid his eloquent tribute to its attractiveness, its condition was anything but favourable to suggestions of external elegance. It was still a quarry, and not until 1816 was the débris of centuries removed and the tomb of the Lion King laid bare, disclosing, as the "Liber Registorum de Aberbrothoci" puts it, a state of national irreverence and neglect.

If Royal Commissions and stately conventions, regal hospitalities and solemn grandeur make a palace, then Aberbrothock Abbey, even in this sense, can claim a nobler title than St. James's, if second only in stirring incident and high emprise to old Holyrood. Surely then one must regret the loss of one single stone, one clustered pillar or jagged architrave, for each is precious with the preciousness of a hallowed antiquity.

But the passing of the tower of St. Thomas proclaims the effacing power which cannot be arrested.

We should desire to remember it, not merely as a great stone idol, but as a mark of much that is interesting in Scottish history, a large part of the luminous panorama of which must have unrolled itself under the shadow of this silent sentinel of time.

### MANCHESTER SOCIETY OF ARCHITECTS.

THE annual dinner of the Manchester Society of Architects was held at the Queen's Hotel, on Friday evening. The president, Mr. Alfred Darbyshire, occupied the chair, and amongst others present were the vice-president of the Royal Institute of British Architects, Mr. John Slater; Sir James Hoy, Mr. Edward Salomons, Mr. John Woolfall (president of the Liverpool Architectural Society), Mr. W. A. Royle, Mr. F. H. Oldham, Mr. John Ely, Mr. J. B. Gass and Mr. J. W. Beaumont. The president of the Royal Institute of British Architects (Mr. Aston Webb), the president of the Architectural Association (Mr. Henry T. Hare), and the Principal of the Owens College were unable to be present.

The Chairman proposed the toast of the Royal Institute of British Architects.

Mr. John Slater replied. He said that while in recent years not so much had been heard of the vexed question of the compulsory registration of architects, many members of the

profession, especially in the provinces, thought that a compulsory registration would be found a panacea for most of the evils from which architects and architecture were suffering. If registration were to come and be a success, it could only be through the ranks of the Royal Institute. He was not altogether without hope that in the not far distant future some practical means of bringing that about would be found. With regard to the work and influence of the Institute, both had increased during the last year or two, and no one who had not sat at the Council of the Institute for some years could have the least idea of the enormous number of professional questions referred to that body. They had been consulted more than once lately by the Government and by public bodies with reference to matters of great public interest, and he was glad that that sort of spirit appeared to be gaining ground. The more municipalities and those who had to do with the architecture of buildings sought the advice of the local societies, the better it would be both for architecture and for the public. Architecture was a profession—or a business, if one preferred to call it so—but it was also one of the fine arts. Indeed, it was the mother of all the arts, because painting and sculpture, and what not, had only achieved their greatest successes when they enhanced the most brilliant pieces of architecture. Treating architecture as an art, no one could possibly exaggerate the influence on the younger generation when they were brought into contact with art and artistic matters at an early stage. Manchester had some most admirable Board schools, well built and well equipped in every way, but with regard to their interiors, the classrooms were not quite as beautiful as they might be, and it would be a good thing if the students at the Art school were encouraged to do something towards the beautification of the Board schools. This would be splendid practice for the art students, and the educational effect on the children of the Board schools would be really great.

Mr. Edward Salomons gave the toast "The Victoria University and the Owens College," to which Mr. Alfred Hopkinson was to have responded. But Mr. Salomons read a letter from Mr. Hopkinson explaining that, in consequence of the death of his friend and colleague, Professor Withers, he could not take the part in the proceedings that had been assigned to him. Mr. Salomons said that it had been expected that Mr. Hopkinson would have made some announcement in regard to the proposed appointment of a professor of architecture at Owens College. There had been a wish on the part of the College, and this had been cordially met by the Society, to appoint such a professor, and after many meetings of the committee appointed by the College and the Society and the School of Technology, the scheme had at last been accomplished, and it had been agreed that a professor should be appointed to fill a chair at the Owens College and to be the teacher of architecture at the School of Technology. The appointment had not yet been made, but certain steps had already been taken towards making it.

Mr. J. W. Beaumont proposed "Technical education," and Sir James Hoy responded. Speaking of the prospective arrangement for filling a chair of architecture at Owens College, he said it was intended that this should be a joint professorship. The professor was to be partly paid by the College and partly by the School of Technology. The initiatory steps were progressing satisfactorily, and there was good reason to suppose that within the next twelve months such arrangements would be made as would place what one hoped would then be the University of Manchester in the same position in regard to the profession of architecture as was at present occupied by the University College of Liverpool.

Colonel Eaton proposed "Allied societies," and Mr. John Woolfall, of Liverpool, responded. Mr. William Goldthorpe gave "The Manchester Society of Architects," and the President replied. Other toasts followed.

#### ULSTER SOCIETY OF ARCHITECTS.

THE annual meeting of the members of this Society was held on the 10th inst. in Ye Olde Castle, Castle Place, under the chairmanship of the president, Sir Thomas Drew, R.H.A. (Dublin). The attendance included Messrs. W. J. Gilliland (vice-president), W. J. Fennell, F. H. Tulloch, Henry Seaver, J. J. Mc'Donnell, J.P.; J. A. Hanna, W. B. Fennell, W. B. Blackwood, T. Houston, T. Roe, J. St. J. Phillips, W. H. Patterson, C. D. Patterson, A. B. Dobson, H. J. Goskar, A. A. Blount, E. R. Kennedy, Vincent Craig, J. C. Lepper and N. Fitzsimons (hon. secretary).

The honorary secretary read the annual report, which contained the following:—When the last annual report (which was also the first) was presented, your Council was engaged in a struggle with the Belfast Corporation to obtain the suitable modification or withdrawal of the objectionable clauses in reference to the elevations of buildings contained in the Bill

then being promoted in Parliament. Deputations from the Society waited on the law and improvement committees, and also attended meetings of the Council for this purpose, but without avail. A petition to Parliament was agreed upon and duly presented, resulting in the rejection of the clauses, and thus a serious infringement on the rights of private property and certain disaster to architectural design in Belfast were happily averted by the action of the Society. The interests of the architectural student and the welfare of art instruction generally have been watched over by your representatives on the consultative committee of the Municipal Technical Institute as far as the limited scope of the powers delegated by the technical instruction committee permits. The claims of Belfast to improved facilities for architectural education were laid before the Irish University Commission by your vice-president in evidence approved of by your Council. It is to be hoped that sooner or later such improved facilities may be provided. A design and sketching club has been established under the supervision of your Council, but managed by a secretary and committee appointed by the members themselves. In co-operation with the Belfast Chamber of Commerce, the question of the reissue of the Ordnance maps of Belfast on a reduced scale in substitution for the present 5-foot scale is still under consideration with the object of having the reissue on the present useful scale. There has been a substantial increase to the membership during the year, the present total being fifty-seven, while several important nominations have been sent in and await election, which will further increase the numbers and add considerably to the strength of the Society.

The report was adopted, on the motion of Mr. H. Seaver, seconded by Mr. V. Craig.

The following office-bearers were elected for the ensuing year:—President, Sir Thomas Drew; vice-president, Mr. W. J. Gilliland; honorary secretary, Mr. N. Fitzsimons; honorary assistant secretary, Mr. W. B. Fennell; honorary treasurer, Mr. H. Seaver; members of Council, Messrs W. J. Fennell, F. H. Tulloch and J. J. Mc'Donnell, J.P.; associate members of Council, Messrs. T. Houston and W. C. Maxwell; honorary auditors, Messrs. J. St. J. Phillips and Vincent Craig.

The meeting afterwards terminated.

#### REMINISCENCES OF RUSKIN.

ON Friday last there was a meeting of the Ruskin Union, held at the Egyptian Hall, Piccadilly, when Mr. Oscar Browning delivered a lecture on "Personal Reminiscences of Ruskin." The chair was occupied by Sir Henry Howorth.

Mr. Browning said the first time he ever heard of the name of Ruskin was on the publication of the first volume of "Modern Painters," in 1856, when he was still a boy at Eton. The first time he saw him was on October 29, 1858, when he delivered his address to inaugurate the Cambridge School of Art, and he could well remember his appearance then—young, slim, and in no way remarkable. It was many years after this that he became personally acquainted with Ruskin. He (the lecturer) was then a master at Eton, and had founded an institution which was called the Literary and Scientific Society. At his special request Ruskin agreed to deliver two lectures before the members of this Society, and he now produced the original copies of the letters addressed to him by Ruskin on that occasion. He had the honour of entertaining him and getting speech with him on that occasion, and he struck him as the embodiment of culture. His dress, his manner, his voice and everything he said seemed to exude a spirit of calmness, and peace, and courtesy, made more noticeable by the rough and tumble disorder of a schoolmaster's life. His (the lecturer's) mother and sisters lived with him, and kept his house, and Ruskin's courtesy to them was absolutely perfect. He seemed to set before them all the higher ideals, both of life and conduct. He had many conversations with him, but he only remembered one thing specially. There hung at the end of his drawing-room three pictures—in the centre Titian's *Flora*, and on each side Raphael's *Madonna Della Sedia* and the *Coronation of the Virgin* by Botticelli, the picture now called the *Magnificat*. When Frank Cornish, the present Vice-Provost of Eton, and himself had gone to Florence as boys in the year 1861 they had been captivated by this picture, then very little regarded, and he had ordered an exact facsimile of the head of the angel holding the crown—a head quite erroneously said to be a portrait of Lorenzo de Medici. It was therefore natural that, standing before this picture with Ruskin, he should say to him, "When I first went to Florence I immediately pitched upon this picture as the best in the galleries." He replied, "I know now that it is, but it took me ten years to find it out." He ought to have replied, "You have not read your own books," but this *esprit* which reminded them of *bons mots* which they had neglected, was only too common. The two lectures were on "The

Swallow" and "The Chough." He did not remember much about them, except that the room they were given in, that beautiful boys' library which is now destroyed, was crowded, and that the boys were delighted. Ruskin stayed on that occasion at Botham's Hotel, Salt Hill, which had now been pulled down. In the summer of 1874 he visited Ruskin in his rooms at Oxford, and he could remember a most delightful conversation, and a lovely portrait of Raphael which hung over the mantelpiece, and which he told him was painted by a fellow-pupil in the studio of Perugino.

Another lecture was delivered by Sir William B. Richmond, R.A., entitled "Recollections of Ruskin" at St. Peter Mancroft Parochial Hall, Norwich. Archdeacon Pelham presided.

In the course of a most interesting paper, says the *Norwich Mercury*, Sir William Richmond said it was longer ago than he could remember that he first saw John Ruskin. The influence of such a masterful as well as engaging personality as Ruskin's was, so magnetic and stimulating, acting upon the sensitive minds of children whose environments as well as antecedents were cultivated, predestined them to receive an indelible stamp from such a seal. Whether as men and women they now agreed with all that Ruskin taught was neither here nor there: this was certain, the best and truest of it all stuck fast, and helped them all to desire to promote beauty, and furnished them with a desire to emulate his enthusiasm, not only keeping it for themselves but, when chance offered, giving it to others. It was indeed a privilege to have had such an intellectual as well as passionate example grafted on early years, to have had it as the very air they breathed and the bread they ate. Ruskin was *facile princeps* as a writer on art, and the most enlightening that literature had produced. They might or might not agree with the light that he shed, but light it was—clear and brilliant, piercing a darkness which had fallen over the minds of Englishmen, convincing them against their will that beauty mattered, and that science, comfort, fashion and worldliness were not or ought not to be sufficient to provide for the wants of a great nation—an example which they would do well to follow, disregarding the gibes of Philistines. Who could deny that every strain of thought, every motive power, however wild, every paradox, however irrational, from Ruskin's pen had as its genitor real enthusiasm? a quality much needed in an age that did not like to "give itself away." His was the very antithesis of the cold northern temperament. His words, said the lecturer, sped like the fire that ran along the ground. They would have destroyed the worshippers of Baal. Some they have destroyed, but a large fraction yet remains, though it is dwindling under the fierce light of truth and a higher motive of altruism. A reaction set in against his teaching not long ago, and rightly, in a measure, because it strengthened what is best and lasting of it and brushed off the cobwebs which had grown up about it. The position of Ruskin is now assured. The fallacies of his teaching are exploded, and the great master stands out for ever as a shining light of his century. When I was a boy, Mr. Ruskin used to come to my father's house to what we called "high tea." In his habit of enforcing speech with gesture he was unlike an Anglo-Saxon—the Celtic blood exerted itself. He had a habit of sitting very low down in his chair—indeed, reclining in it—with his head delved in the recesses of his chest, and while conversation was continuing his periods of silence alternated with rapid utterances pronounced with enormous picturesqueness and eloquence, not argumentary, for he was not a good listener, but dictatorial. Argument and logic were not prominent forces of his mind—imaginative statement was his pronounced identity. The first impression created by his conversation was that he was immensely opinionated. This is true, but he had a right to his opinions because even in the earliest days of his career he had thought a great deal more than most people, and was possessed of a power of stating his conceptions entirely his own, and exercised, if paradoxically sometimes, with eminent sincerity. Ruskin prided himself upon his critical powers, *i.e.* destructive criticism. He resolved, as a child does, to make the doll of the moment into a god. That idol he constructed at the expense of every forerunner who was not in accord with the dream he was making into a reality. Ruskin had real modesty, for no one was more critical of himself than he. His most bitter critics have never exposed his thoughts more trenchantly than he did, but he, unlike many of them, did so with a style so convincing that his criticism of his own mistakes in judgment added strength to his inspiring power. The influence of Turner's minuteness of observation stimulated Ruskin's, whose drawings have not had justice done to them. Their merit has been too much eclipsed by his drawing and painting in words. The Ruskin Union would do well to organise an exhibition of the master's drawings. I know that there was an exhibition of some of them awhile ago, but a complete collection brought together and placed before the public by this Union would, I think, prove a very valuable addition to the services of the Union in promoting the knowledge of the many-sided genius of the

master. I doubt if any artist has ever drawn architecture with more feeling, or made it of rarer artistic interest than Ruskin. He had a most refined sense of form, and as a colourist he was no less remarkable, but it is strange that the inventive faculty which was so strongly marked in his writings does not appear in his drawings at all. He once said to me, "I have no power of design. I can only draw what I see." Dealing with words, he not only described, but he created. "The Queen of the Air" is, to my thinking, one of the most delightful poetic treatises upon Greek myth as connected with cloud and storm ever penned. No one else could have touched the subject with so delicate a hand. In this little book Ruskin has set forth his pantheism and displayed his consummate understanding of that side of the Greek temperament which was in allegiance with mountains, clouds and streams. The pen with which he wrote it diffuses the many tints of Iris's bow into far-reaching words, turning sensitive visions into realities and burning thoughts into visible flames. This, then, is Ruskin's supreme gift: to give eyes to the blind and to those that can see extension of vision, to take us with him, and translate us into regions invisible till our eyes are opened, and, with minds replenished, we mount with him into the chariot of fire and ascend, leaving the cloak of inspiration upon the shoulder of another prophet, saying, "Go and do likewise." The quality of his imagination, high as it was, undoubtedly came more readily into touch with the inanimate than with the animate. As with Shelley, the weakest part of Ruskin's work is where it deals with human emotion as depicted in art. The great emotions, tribulations and tragedies of life disturbed him. He was ill at ease among them; they had no place for him in art, however much they might occupy the political economies of another side of his mind. He could understand the inanimate emotions of clouds; the tumble of the sea was too much for him. His emotion was awakened and his inspiration was enlivened by his acute sensibility to the earlier orders of creations. His pantheism, while it was strong, did not exclude the tragedy of life. This limitation was his strength, as well as a cause of weakness. The cause of it was reaction. The ideal, or what has been falsely called the historic school of painting, was represented to him by the bathos of imitations of the grand style, so often insisted upon by Reynolds in his "Discourses." A keen sensibility to beauty and to the activity of nature's design, rendered anything akin to precedent a place only among insincere motives. This insincerity, which to him was fatal, roused vehement indignation in a soul that revered all created things. Rather than attempt to sound the depths of the pathetic act of Michel Angelo, he took his cue from imitators who failed to do what their master had done, but instead of scolding them Ruskin scolded their master. His real love was Turner, also in a sense from the literary point of view, because he could interpret his art in language. His prose was inspired by a theme which had an almost endless gamut whose each note was contained in the scale of nature, each one vibrating back into his own love, his own observation, which touched the chord of solitariness in a temperament that loved the floating clouds, moss grown rocks and green pastures, more than it could enter into the deeper passions which are inseparable from human life. In its relation to art, Ruskin's mind was like a microscope. It was Aristotelian, not in the least Platonic. It worked from the material to the ideal; from the small to the great, not from the great to the small. But in his ethical and political writings the ideal is predominant. He was a man of many moods. For a time the broader handling of David Cox succeeded his delight in the minute refinement of Turner; and he was then picking holes in some of his own views. This change in opinion did not surprise me much because, with that intuitive justice and sense of the illogical in the young mind, I had detected his tendency to paradox. His power of enlisting and sustaining enthusiasm was phenomenal. As a lecturer his power was transcendent. Yet the most characteristic parts of his discourse were those when he left his text, and rambling away from the subject immediately in hand conversed enigmatically about art as a cosmic function in life—when he drew spontaneous and prophetic word-pictures of passing themes, made game of the self-made man, of society, of vulgarity, of the Philistine, and weaved ethics with æsthetics, so charmingly, in sentences complete in style and bristling with illustrations. His kindness and consideration for all his domestics and dependents was extended to all classes with whom he came in contact. There was not the least vein of snobbishness in his nature. His love of music was sincere, but very limited. It is strange that with his unique appreciation of the rhythm of prose and verse, that he cared for the tritest melodies, and sentimental songs, if accompanied by words congenial to him, he pronounced to be masterpieces. Here again is an illustration of the absence of the epic quality. Beethoven's music said little to him, nor do I think that Handel moved him much, but Moore's melodies, beautiful certainly, but in a small way, and such songs as "John Anderson, my Jo, John," and

Scotch ballads immediately appealed to his sensibilities. His immense admiration for Scott's poetry is puzzling. Greatly as he admired Scott's prose, I think his inclination was to prefer his poetry. It is impossible to gauge the stimulus that Ruskin gave to the pre-Raphaelite movement. When that was initiated by the little band of workers who determined to see nature as she is and to interpret her with strict veracity, the art of painting had become stereotyped by convention and hide-bound by precedent. To the Philistine the efforts of Hunt, Millais and Rossetti were inspired by affectation; the truth and innate sincerity, the very foundation of those efforts, were regarded as an expansion of strangeness and ugliness. When Morris said "Ruskin has made art possible in this country," he spoke the truth. His burning words and powerful analysis have set art upon an intellectual pinnacle in the eyes of the educated public that it has not occupied since the great days of the Renaissance. It is through Ruskin, he being the primal cause of it, that the minor arts are now taking a place in our life. It is he who has set us thinking that beauty should weave through life as the threads of a great tapestry. Morris took up those threads, and by his indomitable energy and practical skill added to Ruskin's theoretical teaching by expanding it as well as by putting it into practice. In the broad sense, Morris was Ruskin's pupil; he carried to an extreme whatever elements exist in Ruskin's teaching that tend towards undeveloped socialism. The output of Morris's social policy was generated by Ruskin's ethics.

In responding to a vote of thanks, Sir William Richmond said what they had to do now was to try to follow out the main principles of a life which taught, not only in words, but in its living, the great art of the beauty of life. That was the main feature of Ruskin's teaching. He told us not only to look at beautiful things, but to try to maintain them. There was such a thing given to them as pure air and the rays of the sun. London became almost uninhabitable, mainly because of the ghastly selfishness of manufacturers, who were absolutely determined to defy the Act of Parliament. Now, these men he (Sir William) regarded as sinners in the worst sense. In order, as they thought, to add a small percentage to their year's income they were preventing in the neighbourhood the growth of beautiful flowers, plants, shrubs and fruit, which ought to be the possible possession of every leaseholder and of everyone who desired to enjoy the fruits of the earth. One reason of the great deterioration of the beautiful buildings of large towns was the acid and carbon which was deposited on the surface of the stone, and which served to disintegrate it and caused it to scale off. Even in those parts of the cathedral which had recently been restored this was happening in Norwich to-day. He held that all town and borough councils which did not put in force the Act of Parliament which gave them powers to abate this nuisance were extremely remiss, and he might add that the initial expense entailed in preventing the waste of fuel was slight in comparison to the after benefit to the manufacturer himself.

#### EXPLORATION OF THE TIBER.

FROM time to time projects are announced for seeking treasures in the bed of the Tiber. A correspondent of the *Springfield Republican* gives the following account of one which now is receiving attention:—

Professor Ciro Nispi-Landi, the author of the latest scheme for exploring the bed of the river Tiber, is no mere "dreamer." A man of profound learning, he now holds the responsible position of inspector of national monuments to the Italian Government, and is the author of several thoughtful works on ancient Rome. It was the Professor's historical studies and researches that inspired him with his great idea of searching the Tiber for treasures. They directed his attention first to the length of time during which Romans, rich and poor alike, cast into the slow-flowing river their most cherished possessions, and also to the period, unexampled in history, of thirty-four centuries in which the Tiber was the centre of momentous events. Professor Nispi-Landi's notions were strengthened by what he saw while in charge, several years ago, of the work of building the Tiber's embankment. The Professor noticed, as he tells me, that "whenever and wherever the Tiber was searched in the course of bridge-building or of the work on the embankment, ancient and valuable things always came to light." Generally they were valuable enough to pay the entire cost of the operations. For instance, one Italian bridge-building firm, in laying the two pillars of the Ponte Palatino, discovered antiquities to the value of several million lire. In adjusting the foundation-pillar of the Ponte Garibaldi three beautiful antique bronze statues, one of Bacchus and one of Venus, came to light, and in widening the Ponte Cestio antique jewellery, one piece of which was a wonderful gold collar of turquoise, and other valuable relics were drawn up from the depths, where they had lain for years. In the course of the complete work on the embankment enough ancient works of art and other relics were

discovered to stock one of the richest museums in Rome—that of the Baths of Diocletian.

"Most of the treasures," remarked the Professor, in response to one of my questions, "are certainly to be found in the most central part of the river, and have remained undiscovered for that very reason." He consented to give a hint of his plans. He has, for this purpose, divided the Tiber into "zones" or districts. They are eleven in number, No. 1 covering most of the Tiber in Rome proper, the others the course of the river outside the Eternal City. "We shall proceed," said the Professor, "by digging parallel trenches for the first zone, where the ancient source of the river is dried up, with the aid of steam pumps, and where the Tiberine waters follow their natural course with pneumatic tanks modified and adapted to the special use of river exploration." The enterprise will be financed by Chevalier William Millar, a wealthy Anglo-Italian of Leghorn, who has implicit confidence in the savant's scheme. Just when the actual work will be begun is not yet decided. The permission of the State was given to the enterprise some time ago, but recently some "recommendations" have been made by the Museum of Antiquities. Compliance with them has delayed matters, and it may be some time before the delving begins in earnest.

Search in the Tiber always has been richly rewarded. The Professor goes back as far as the thirteenth century, quoting one of its historians, Falminio Vacca, who described how a small boat having sunk near the Ponte Sublicio and several swimmers being engaged to fish it out, arrows, swords, breast-plates, arms of every description "and other beautiful objects," recognised as purely Etruscan, were discovered and brought to the surface. But, after all, it is necessary only to review one's Roman history a little to convince anyone that there should be riches in the Tiber. That they were put in is certain, and Professor Nispi-Landi states that in all his research he has been unable to find any record of any large quantities of them having been taken out. The records of sacrifices to the Tibertine deity go back to the beginnings of Roman history. Even Virgil tells how Æneas promised Father Tiber that if he would protect him from peril, "Thou shalt ever be worshipped by me with homage and with gifts." The example of Æneas was followed by the generations that came after him. Sacrifices were made on the eve of great events, such as battles, during times of national peril, to make sure of having the god on the suppliant's side, during great rejoicings, and to commemorate illustrious men who had died. These were the great public sacrifices, of course, but private individuals in prosperity and grief offered personally similar sacrifices, generally the most precious things they owned. Back in the time of the Arcadians men used to be hurled into the Tiber, but soon they were replaced by puppets and graven images, and after this the offerings of money, jewellery and precious things began.

It was not only the Romans who sacrificed to Father Tiber. The superstitions of all the Southern races seem to have been pretty much alike at this time, and whatever force was near the river made votive offerings to it. The Huns, the Goths and the Vandals all hurled a large part of the plunder derived from their sacks of Rome into the ancient stream. "Such offerings were," says Professor Nispi-Landi, "the cause which contributed chiefly and for the longest period to enrich the bed of the Tiber with precious relics." Another cause, however, was the casting into the stream by the Romans of their possessions in order to prevent their being captured by enemies. For instance, after the defeat of Maxentius Saxa by Constantine, say the records, "not only a great number of dead and wounded men and an immense quantity of arms and valuable objects, but even the treasures of Maxentius and the military chest of his army were thrown into the river to prevent their falling into the hands of the victorious foe." To save them from the Huns, and later on from the French, marbles, bronzes, statues, busts and costly images enriched the Tiber. Add to all this treasure the hundreds of rich pagan statues and temple ornaments thrown into the river by the Christians, and the property of all who conspired to bring about the assassination of Cæsar, which had a similar fate, and an idea will begin to form of the vast treasures on the Tiber's bottom.

This Italian scholar, whose works "Rome before Humanity" and "M. Agrippa and his Temple," are, by the way, well known in Italy, has not by any means contented himself with the conviction that treasures in the aggregate are below Tiber waters. He has drawn up for himself a list of individual relics of which history speaks, and has attempted to locate each in one of his "zones," according to the details which he has been able to gather as to its sacrifice. For instance, the Professor believes that the sacred candlestick of Moses, the object that he would like best of all to recover, will be found in its first zone, or in that part of the Tiber near the famous Castel Angelo, close to the Vatican and St. Peter's, probably that part of the river that most Americans have seen.

Says the Professor:—"It is certain that religious objects were left untouched by the superstitious Alaric and Genseric; indeed, in 509 and 529 the candlestick was still to be seen in

Rome. I regard it as certain that the emblem ordered on Mount Sinai, which stood in the Tabernacle of King David, which was carried round the walls of Jericho and was venerated by Cæsar and Pompey, was eventually lowered by the Jews down from the bow of Æsculapius's ship on Tibertine Island in our first zone. The Jews themselves always have asserted that it is there. Consider that more than 1,900 years have passed since then, and that the candlestick was then about 1,550 years old, making a total of 3,448 years. What importance would its discovery have? Who should have the greatest claim to its possession? How much should be paid to the discoverers? It is not easy to answer these questions. Everything should be as wonderful as the candlestick itself."

Professor Nispi-Landi will be one of the most disappointed men in the world if he does not bring up from the Tiber's bed thousands of suits of rich armour, of swords and shields, the property of the wounded men who through custom were hurled into the river and those that fell in the fearful battles on the bridges. Among these he expects will be the armour of brave old Horatius Coclès and his men, who kept the Pons Sublicius against the Etruscan army, and finally leaped into the Tiber. "There must be," he writes, "in that part of the river arms, coins, ornaments, jewels, such as buckles, collars and rings, all rare and valuable as the only relics of the Romans and Etruscans of those days." He expects to find the famous Minerva statue of Phidias, as well as those of Hercules, Mars and Venus, with the pearl of Cleopatra. He believes he will bring to light the solid gold statue of Claudius II., which once stood in the Capitol, and which was thrown into the Tiber to save it from the Goths.

Probably one of the first questions that will come into the mind of anyone who reads this story of Professor Nispi-Landi's great project will be:—If the Tiber is so rich in treasures, why has no one tried to get them before, or at least why has no one thought of doing so? Well, for hundreds of years men of an ingenious turn of mind have been pondering upon doing and attempting to do that precise thing. For his scheme of searching the Tiber's bed, Professor Nispi-Landi claims no originality; he claims only to be the first man who has yet set doing it with the proper mechanical devices. The list of those who in modern times have attempted to make the Tiber disgorge is headed by the name of the learned Cardinal de Polignac, who planned to deviate the Tiber from its course for about two miles, and then to dig for the antiquities which he believed were discoverable. Pope Benedict XIV. smiled on the cardinal's project, but while the necessary capital was being gathered the Pope died, and his successor was dissuaded from aiding De Polignac, on the ground that the climate of Rome might be injured.

In 1773 Don Alfonso Bruzzi undertook the exploration of the Tiber by means of a cofferdam of his own invention. The device did not come up to expectation, for the water rose and overturned it. Yet, for the short time it worked, enough was found to pay all costs and leave a profit. The scheme of Joseph Naro, in 1815, was not so successful. He, too, believed the Tiber to contain treasure, but he tried to get it by means of a kind of mudscraper, a "grattina," as he called it, which, whenever an incumbrance was met, was planned to strap it and draw it up. Only fragments of statues, marble blocks and funeral columns were, however, brought up by the "grattina." Garibaldi dreamed of searching the Tiber, but he, too, wished to deviate the course of the river, and this the Italian Parliament refused to allow. The most recent man of celebrity to consider exploring the Tiber was the late Prince Alexander Torlonia. He, however, wanted to keep so much of what he found that the Government refused to grant him permission to make a trial. The Prince had felt so certain of success that he offered to deposit as a guaranty for the work the sum of a million and a half of lire, 300,000*l*.

Professor Nispi-Landi believes that he at last will succeed. He says:—"I have now fulfilled all the formalities required by the Minister of Public Works, and the ministerial decree will enable us, with new means and a positive and practical prospectus, to see the great river searched at last, and the abundant riches of intrinsic and artistic value of every ancient epoch triumphantly recovered. Let only fortune smile on our enterprise and merit and riches are ours."

## TESSERÆ.

### Athenian and Roman Theatres.

IN Athens the drama was, as it were, an act of worship—it formed an integral part of a joyous yet serious religious festival. The theatre was a temple, the altar of a deity was its central point, and a band of choristers moved in solemn march and song in honour of the god and, in the didactic spirit which sanctified their office, taught men lessons of virtue. Not that the audience entered the precincts with their hearts imbued with holy feelings or with the thoughts of worshippers; but

this is always the case when religious ceremonials become sensuous. The real object of the worship is by the majority forgotten. But still the Greeks were habituated, unconsciously, to be affected by the drama, as by a development of religious sentiment. With the Romans, the theatre was merely a place of secular amusement. The thymele or altar of Dionysus existed no longer as a memorial of the sacrifice to the god. The orchestra, formerly consecrated to the chorus, was to them nothing more than stalls occupied by the dignitaries of the state. Dramas were certainly exhibited at the great Megalensian games, but they were only accessories to the religious character of the festival. A holy season implies rest and relaxation—a holiday in the popular sense of the word—and theatrical representations were considered a fit and proper species of pastime; but as religion itself did not exercise the same influence over the popular mind of the Romans which it did over that of the Greeks, so neither with the Romans did the drama stand in the place of the handmaid of religion. The style in which the Roman theatres were built indicates that whatever taste for tragedy the Roman people possessed had now decayed. The huge edifice erected by Pompey was too vast for the exhibition of tragedy. The 40,000 spectators which it contained could scarcely hear the actor, still less could they see the expression of human passions and emotions. The two theatres, placed on pivots back to back, so that they could be wheeled round and form one vast amphitheatre, show how an interest in the drama was shared with the passion for spectacle, and provision was thus publicly made for gratifying that corrupt taste which had arrived at its zenith in the time of Horace, and interrupted even comedy so early as the times of Terence.

### Louis Jacques Maude Daguerre.

Daguerre was favourably known to the world before the announcement of his discovery of the daguerrotype. His attempts to improve panoramic painting and the production of dioramic effects were crowned with the most eminent success. The following pictures attracted much attention at the time of their exhibition:—"The Midnight Mass," "Landslip in the Valley of Goldau," "The Temple of Solomon" and "The Cathedral of Sainte Marie de Montreal." In these the alternate effects of night and day, of storm and sunshine, were beautifully produced. To these effects of light were added others arising from the decomposition of form, by means of which—for example, in "The Midnight Mass"—figures appeared where the spectators had just beheld seats, altars, &c.; or, again, as in "The Valley of Goldau," in which rocks tumbling from the mountains replaced the prospect of a smiling valley. The methods adopted in these pictures were published at the same time with the process of the daguerrotype by order of the French Government, who awarded an annual pension of 10,000 francs to Daguerre and M. Niepce, jun., whose father had contributed towards the discovery of the daguerrotype. Originally a scene-painter, Daguerre became desirous of executing his works so as to produce the greatest possible illusion. To his exertions for this purpose the beautiful pictures exhibited for a succession of years at the Diorama, Regent's Park, owed their origin. In these great works he was associated with M. Bouton. The view of Holyrood Chapel, which was exhibited at the commencement of the Diorama, astonished everyone with its complete illusion. Although this exhibition did not combine all the advantages of the panorama, yet it produced a far greater degree of optical illusion. The peculiar and almost magical effect of M. Daguerre's invention arose from the contrivance employed in exhibiting the painting, which is viewed through a large aperture or proscenium. The spectator was kept in comparative darkness, while the picture received a concentrated light from a ground-glass roof. The transitions from ordinary daylight to sunshine or to darkness were produced by shutters attached to the glazed ceiling. Besides which some parts of the paintings were transparent, admitting of being lighted from behind. The combination of transparent, semi-transparent and opaque colouring, still further assisted by the power of varying both the effects and the degree of light and shade, rendered the Diorama the most perfect scenic representation of nature, and adapted it peculiarly for moonlight subjects, or for showing such accidents in landscape as sudden gleams of sunshine or lightning. It was also unrivalled for showing architecture, particularly interiors, as powerful relief could be obtained without that exaggeration in the shadows which is almost inevitable in every other mode of painting. But the scientific acquirements and active mind of M. Daguerre bequeathed a greater benefit to mankind than the Diorama in the wonderful discovery of a mode of obtaining portraits and views by the action of sunlight upon prepared metal plates so well known as the daguerrotype. The idea, however, was not original with Daguerre and his co-partner, M. Niepce, for in 1802 Wedgwood, assisted by Sir Humphry Davy, had obtained sun-impressed images upon glass prepared with nitrate of silver, but not being able to fix them, or prevent the continued effect

of the sun upon them, the process was abandoned for a time. In 1827 M. Niepce produced some specimens of pictures upon glass, copper-plated with silver, and highly-polished tin, after which he soon entered into partnership with M. Daguerre. The latter, after repeated and, it would seem, fruitless attempts to prepare a sensitive paper, entered upon those experiments which ended in the discovery of the beautiful process on silver plates which bears his name. In the interval Mr. Henry Fox Talbot made known the results of his inquiries into the action of light upon salts of silver in a paper read before the Royal Society in January 1839. This invention is called, in compliment to him, the *Talbotype*. So important was the discovery of Daguerre deemed by the French Government that, in consideration of it being thrown open to the world, they granted annuities for life to Messrs. Niepce and Daguerre, but owing to some ingenious legal construction England was considered out of the world, M. Daguerre's process patented and locked up in this country. It does not appear that M. Daguerre made further advances in his astonishing discovery, for most of the improvements have originated with other practitioners.

#### Domesday Book.

Domesday is a wonder—almost a miracle. One can hardly look at it without feeling some share of that mysterious awe with which its author was looked on by his own contemporaries. It is the Conquest, or rather it is the Conqueror himself, set before us in black and white. The idea of producing such a living picture of his whole kingdom was truly worthy of the mighty genius of William the Great. The conception is one under the circumstances at least equal to the conception of Justinian. The conception of Justinian was simply to carry out in greater perfection the conceptions of those who had gone before him. Generations of able lawyers had been for ages collecting the raw material, and the example of putting their labours into something like shape had been set by the Theodosian code. But the conception of William, if less grand, permanent and scientific than that of Justinian, was distinctly more original. We know of nothing earlier than itself, in England or out of England, which could have suggested the idea of Domesday Book. The work had never been done before, and in the ages that have passed it has never been done so thoroughly again. We know also the very natural horror and prejudice which were awakened by the searching inquiries needed for its composition. "It is a shame to tell what he thought it no shame to do," says the contemporary chronicler in his graphic description of the work. No doubt this dislike partly arose from the feeling that a foreign conqueror was in fact drawing up the record of his conquest; that one grand result of the inquiry would be to set forth in an imperishable shape how vast a portion of the soil of England had passed into the hands of the foreign king and his foreign followers. But this was not all. We may be sure that in those days an inquiry of this sort would have been enough to ruin the popularity of the most popular of native kings. Probably only a conqueror would ever have thought of it; probably only the Conqueror could have carried it out. But William did carry it out, and he is worthy of all admiration for so doing. The execution is on the whole worthy of the conception. The difficulties in the way of carrying out such a work must have been enormous. It must have needed the co-operation of men of both nations. William's immediate agents would doubtless be mainly Normans, but they must have employed or examined countless Englishmen, and besides the probable mutual feelings of national dislike, they had to get over the difficulties of their own no doubt very imperfect knowledge of the laws, customs and tongue of Englishmen. That they made the same sort of havoc of English names which Frenchmen do to this day is in no way wonderful. Perhaps the wonder is that the havoc was not greater than it is. The names of places are on the whole fairly represented; no doubt special care was taken on that point. It is before the names of English men and women that they seem to have fairly broken down. Almost every Old-English name is spelled in as many ways as Shakespeare's name was spelled in his own time.

#### GENERAL.

The Emperor of Austria will present to the Pope, on the occasion of the Pontifical jubilee, a gold statuette representing the Good Shepherd. The statuette is the work of the Viennese sculptor M. Rudolph Marshall, who has also executed a large medallion portrait of the Pope in gold, intended as a jubilee gift to his Holiness from the city of Vienna.

The Blackmore Memorial Committee have adopted a design for the memorial which is to be erected in Exeter Cathedral to the author of "Lorna Doone."

Mr. John Faed, R.S.A., the painter, left property valued at 10,418*l*. Mr. C. H. Beloe, civil engineer, of Liverpool, has left estate worth 62,709*l*.

The Corporation of Lowestoft have spent nearly 58,000*l*. during the last six years in defences against the encroachment of the North Sea. The amount expended is about one-half the rateable value of the town.

The Blockhouses in the Transvaal and Orange River colonies having been taken over by Lord Milner for a lump sum of 50,000*l*, are on sale to the inhabitants of the districts at prices varying according to size.

A Tablet is to be placed in the Zoological Gardens in memory of the late Mr. J. Nettleship, the animal painter, and another in the parish church of his native town, Kettering.

The City Churches Preservation Society have protested against the demolition of All Hallows, Lombard Street. It was resolved to obtain opinions from the various antiquarian societies upon the suggested sale, and to use every effort to preserve the church.

The Court of Common Council have agreed to co-operate with the London County Council in endeavouring to obtain the appointment of a select committee of Parliament to hold an inquiry into the breaking up of streets in London by various companies.

Mr. R. Singer Hyde, architect and surveyor, of Eriswell Road, Worthing, has taken his son, Mr. R. W. Wentworth Hyde, into partnership with him, and the firm is now known as Messrs. Singer Hyde & Son.

Sir Samuel Scott, having purchased the Old Manor, Westbury, Bucks, from Lord Barrington, has demolished the building in order to erect on its site a new residence, costing about 40,000*l*.

The Woolwich Borough Council, on the recommendation of the works committee, have decided that the making-up of roads, construction of sewers, excavations for new municipal offices, proposed new free library, public baths and washhouses for Plumstead, new recreation ground for Eltham and other works shall be expedited with a view of providing work for the unemployed.

The Chateau d'If, in the port of Marseilles, which has been immortalised by Alexander Dumas, has been let for two years at a rent of 1,000 francs to a speculator, who will charge for admission.

An Exhibition will in all probability be arranged at the British Museum during the coming summer of the series of mezzotint engravings bequeathed to the nation by the late Lord Chylesmore.

Mr. William Le Queux, who is making excavations of Roman remains at Castor, Northamptonshire, on Saturday discovered in a field close to the remains of the ancient Ermine Street the floor and boundary walls of a temple. The floor is 40 feet long by 20 feet wide, beautifully tessellated in a design of white and red, and is in perfect preservation. Quantities of red fresco have been dug out, together with bones, ashes, Roman pottery and glass. In the centre of the floor is a large pear-shaped hollow, about 2 feet deep and 10 feet wide, in the middle of which are remains of the base of the altar.

The Government of South Australia has called for tenders for the construction of a Transcontinental railway, connecting Adelaide and Port Darwin, on the land grant principle. Tenders will shortly be advertised for in England, France, Germany and America.

Mrs. Georgina Buckeridge Roberts, of 14 Hyde Park Mansions, who died on October 16 last, bequeathed to the Science and Art Department of the Kensington Museum such of her collection of Chinese enamel, pottery and embroidery as the director of that department shall select.

Owing to the ruinous condition of the roof of Sherborne Abbey, the splendid groining is in danger. An appeal is to be made for funds to repair the roof.

Two Busts of Sir A. Sullivan, one in marble and one in bronze, were delivered last week to the Royal College and to the Royal Academy of Music. The London County Council have authorised the erection of a bust of the composer on the Thames Embankment, as nearly as possible opposite to and facing towards the Savoy Theatre. Mr. Goscombe John, A.R.A., is the author of the three works.

Mr. David G. Hogarth, M.A., Fellow of Magdalen, has been awarded a grant of 100*l*. from the Craven Fund by the Oxford Convocation in aid of researches and exploration at Naucratis.

The Works Committee of the London County Council have submitted the half-yearly statement of the estimated and actual cost of works carried out by the Works Department, completed during the half-year ended September 30 last. The statement showed that on eighteen works estimated to cost 103,725*l*. there had been a saving, or a balance of cost below estimate, of 9,629*l*, or nearly 10 per cent. The jobbing works also showed a saving amounting in the aggregate to over 2,000*l*.

THE

## Architect and Contract Reporter.

## Important Notice.

Owing to the Christmas Holidays "The Architect" will be published on Wednesday, December 24. All Advertisements, Tenders, Competitions, and Contracts Open intended for insertion in that issue must reach the Office, Imperial Buildings, Ludgate Circus, E.C., not later than 3.30 p.m. on Tuesday, December 23.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

ASHTON-IN-MAKERFIELD—Dec. 31.—Designs, &c., are invited for the enlargement of the Infectious Diseases Hospital. The architect whose plans are accepted and approved will be retained by the Council to carry out the work at the usual pro-

fessional charges. Plan of the hospital site, together with full particulars of the alterations and extensions required, may be obtained from Mr. T. Burgess, surveyor, at the Council Offices.

BRIDGWATER.—Feb. 28.—Plans, specifications and estimates are invited in competition for power and appliances to deal with the accumulations of silt in portions of the river Parrett. Mr. W. T. Baker, town clerk, King Square, Bridgewater.

CAPE TOWN.—Jan. 31.—The Council of the University of the Cape of Good Hope invite designs for the erection of university buildings. Premiums of 400*l.*, 200*l.* and 100*l.* will be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

HULL.—Mar. 31.—Designs in competition are invited for the extension of the town hall. Premiums of 300*l.*, 200*l.* and 100*l.* are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

KINGSTON-ON-THAMES.—Jan. 15.—Plans and designs are invited for a central home and cottage homes for children of both sexes in the Kingston Road, in the parish of New Malden. A premium for the first three selected plans of 25*l.*, 15*l.* and 10*l.* respectively is offered. Mr. Jas. Edgell, clerk, Union Offices, Coombe Lane, Kingston-on-Thames.

ST. IVES, CORNWALL.—Jan. 31.—Competitive plans are invited for the erection of municipal buildings, to consist of a guildhall, council-chamber, jury room, public hall, town clerk's office, surveyor's office, treasurer's office, muniment room, parochial office, mayor's parlour and fire-brigade station and offices. Premiums of 70*l.* and 30*l.* respectively will be awarded to the architects whose plans and specifications are considered to be first and second in order of merit. Mr. Edward Boase, town clerk, Town Clerk's Office, St. Ives, Cornwall.

SUTTON COLDFIELD.—Feb. 20.—Designs are invited for the erection of a town hall adjoining the council house, the total expenditure to be limited to 7,000*l.* Premiums of 50*l.*, 30*l.* and 20*l.* respectively will be awarded for the three best designs in order of merit. Mr. W. A. Clarry, C.E., borough surveyor, Council House, Sutton Coldfield.

## CONTRACTS OPEN.

AUSTRALIA.—Dec. 22.—For erection at Perth, Australia, of a rubbish destructor capable of dealing with forty tons of garbage in eight hours. Mr. W. E. Bold, town clerk, Town Hall, Perth.

BARNSELY.—Dec. 22.—For erection of two houses and outbuildings at Darton. Messrs. Crawshaw & Wilkinson, architects, 13 Regent Street, Barnsley.

BARNSELY.—Dec. 22.—For alterations and additions to house, Gawber Road, Barnsley. Messrs. Crawshaw & Wilkinson, architects, 13 Regent Street, Barnsley.

BETHNAL GREEN.—Jan. 5.—For erection of dormitories maternity wards and other buildings at Waterloo Road workhouse, Bishop's Road, Victoria Park, N.E. Mr. W. A. Finch, architect, 76 Finsbury Pavement, E.C.

BIRMINGHAM.—Dec. 22.—For erection of scullery out-houses, &c., and other alterations at the workhouse, Gravelly Hill. Mr. John North, clerk to Guardians, Vauxhall Road, Birmingham.

BOOTLE.—Jan. 2.—For erection of superstructure of a school for 1,000 children, Linacre Lane, Bootle, Lancs. Mr. Thomas Cox, architect, 11 Dale Street, Liverpool.

BRIDLINGTON.—Dec. 23.—For alterations to 1 and 3 Promenade. Mr. J. Earnshaw, architect, Carlton House, Bridlington.

BRIDLINGTON.—Jan. 3.—For erection of new terrace steps and alteration of the present steps at Bridlington grammar school. Mr. John Woodmansey, secretary to the Governors, 24 Cambridge Street, Bridlington.

BRIGHTON.—Dec. 23.—For the construction of the permanent way of the tram roads in London Road, St. Peter's Place, York Place, Pavilion Parade, and Old Steine, &c, including the bonding and all contingent works, and paving with wood the whole of the area of such roads, including the tramway tracks. Mr. Francis J. C. May, surveyor, Town Hall, Brighton.

BRISTOL.—Dec. 31.—For second instalment of the superstructure of the Avonbank electricity works, Feeder Road, comprising steelwork, masonry, concrete, &c. Mr. H. Faraday Proctor, city electrical engineer, Temple Back, Bristol.

DORKING.—Dec. 31.—For alterations and repairs at the workhouse. Mr. William Shearburn, architect, South Street, Dorking.

DURHAM.—Jan. 5.—For erection of new Board schools at Heworth. Mr. H. Miller, architect, Felling.

ESSEX.—Jan. 7.—For erection of the Carnegie free library at Grays, Essex, and for furnishing, lighting and heating the same. Mr. Christopher M. Shiner, architect, 6, 7 and 8 Crutched Friars, E.C.

GOOLE.—Dec. 30.—For erection of a mortuary chapel at Swinefleet. Mr. H. B. Thorp, architect, Goole.

GRASMERE.—Jan. 3.—For rebuilding Goody Bridge, Grasmere, Westmorland. Mr. J. Bintley, 7 Lowther Street, Kendal.

GREAT AYTON.—Dec. 29.—For erection of proposed new police-station, &c., at Great Ayton, Yorks. Mr. Walter H. Brierley, county architect, 13 Lendal, York.

HASLINGDEN.—For erection of brick chimney. Messrs. Nicholas, Tomlinson & Sons, Plantation Mill, Haslingden.

HASTINGS.—Dec. 22.—For alterations and additions to the public convenience, Mercer's Bank, Rock-a-Nore, Hastings. Mr. B. F. Meadows, town clerk, Town Hall, Hastings.

HAVERHILL.—Jan. 3.—For rebuilding Melborn Bridge, Haverhill, Suffolk. Mr. A. Ainsworth Hunt, county architect, Sudbury.

WOLVERHAMPTON.—Dec. 20.—For supply of about 45 new church benches. The Rev. J. J. Darmody, St. Patrick's, Wolverhampton.

### NEW CATALOGUE.

ONE of the most elegant and artistic catalogues that we have seen for quite a long time is that which has just been prepared by the Electrical Fittings Company, of 38 Conduit Street, New Bond Street, W. It may fitly be described as an album of graceful design. Lavishly got up as to cost and labour, it is printed on superfine thick paper, aesthetically bound, and its hundred and odd pages are adorned with a profusion of designs for electric-light fittings which combine in a rare degree the qualities of elegance, simplicity and refinement; while the prices, which are in all cases fully given, are distinctly moderate. Architects who need to specify for such goods should certainly procure a copy of this admirable catalogue.

*Received too late for Classification.*

### COMPETITION OPEN.

WALES.—Designs are invited for new public offices which it is proposed to erect at Pontypridd. Mr. J. Colenso Jones, District Council Offices, Pontypridd.

### CONTRACTS OPEN.

SCOTLAND.—Dec. 23.—For electric lighting of district library, Anderston. Messrs. Stewart & Paterson, architects, 143 West Regent Street, Glasgow.

WALTHAMSTOW.—Dec. 23.—For the construction of about 480 lineal yards of 9-inch stoneware pipe sewer, with all necessary manholes, &c., in Oak Hill Road. Mr. George W. Holmes, engineer to the District Council, Town Hall, Walthamstow.

### TRADE NOTES.

THE new infectious diseases hospital, Bury, is being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves with descending smoke flues, patent Manchester grates, exhaust roof and inlet ventilators.

THE Foundry Wesleyan chapel, Hayle, Cornwall, has recently been fitted with the well-known "Small Tube" hot-water heating apparatus by Messrs John King, Ltd., engineers, Liverpool, employing their latest improved economical coil heater.

MESSRS. ANDREW HANDYSIDE & CO., LTD., of Derby and London, makers of steel roofs, bridges, buildings and structures, have received the contract for the supply and erection complete of steelwork for roof over generating station for Messrs. Harland & Wolff's shipyard at Belfast.

THE inhabitants of Bentham and district (Yorks) are going to commemorate the Coronation by erecting a large clock at the town hall, with three external illuminated dials, and striking the hours on a new bell. The order has been placed with Messrs. W. Potts & Sons, clock manufacturers, Leeds.

MESSRS. GOODWIN, BARSBY & CO., engineers and iron-founders, St. Margaret's Ironworks, Watling Street, Leicester, inform us that they have been successful in securing an order for one of their patent Acme portable stone breakers, with new patent portable screening apparatus, from the Urban District Council, Holyhead.

AT Moulton, Northampton, a large church clock having two dials, each 6 feet 6 inches diameter, facing west and south, with Cambridge chimes on four bells, was completed on the 11th inst., and formally started and dedicated on that day by the Dean of Peterborough. The clock is to the designs of Lord Grimthorpe, and the work has been carried out by Messrs. John Smith & Sons, Midland Clock Works, Derby.

MR. GEO. SHREWSBURY, of Calda Works, Station Road, Camberwell, manufacturer of the "Calda" instantaneous water-heater for baths, &c., draws our attention to the fact that it is now over twenty-five years since the first introduction of this heater (which has been improved later), and respecting which he claims that no accident has been recorded against it. By Mr. Shrewsbury's system perfect ventilation is insured, a matter which is obviously of primary importance. Mr. Shrewsbury holds numerous testimonials from users during a long period of his "Caldas," and notably one respecting a machine which has been in use for upwards of twenty years, and is still in full working order.

MESSRS. KAYE & CO., LTD, manufacturers of Portland cement, Southam Works, Rugby, have just completed an installation of new grinding machinery which enables them to meet the growing demand for finely ground cement. For the future their ordinary grade will be one giving under 10 per cent of residue on a 76 mesh sieve—5,776 holes to the square inch (the ordinary grade hitherto has left upwards of 20 per cent of residue on this sieve). This increased fineness will much enhance the value of the cement by the enlargement of its covering power or sand-carrying capacity. It will thus be possible to make cement go further by using more sand, &c., with it, or if it is preferred to adhere to the same proportions as before greater strength in the work executed with it will be attained.

MESSRS. MACARTNEY, M'ELROY & CO., LTD, contracting engineers, of London, have obtained the contract to equip Lorenzo Marques, Delagoa Bay, with a complete system of electric tramways, including power-station, rolling-stock, track and overhead lines. The value of the contract is estimated at 100,000/-. There was very keen competition from German and American engineering firms, but Messrs. Macartney, M'Elroy & Co undertook to complete the work in three years, the time a German firm required, while their tender was under that of the Americans.

COACHMAKERS' HALL, NOBLE STREET.

CATHEDRAL SERIES: HEREFORD.—CORNER OF NORTH TRANSEPT.  
GARGOYLE IN CLOISTERS.**ELECTRIC NOTES.**

THE vicar and churchwardens of the Saltburn parish church have accepted the tender of Messrs. Hutton & Walker—wiring 150*l.*, fittings 100*l.* 3*s.*—for the electric lighting of the edifice.

THE town clerk of Dalkeith has received from the electric-lighting company which the Town Council some time ago agreed to employ the proposed scheme for the lighting of the burgh. The underground mains are to consist of single bitumen insulated cables laid in pairs in specially treated wooden troughing filled in solid with pure bitumen and covered with substantial tiles. For the most part they will be laid under the roadways to avoid the cutting of the cement pavements. A number of pillars will be erected on the pavements for the purpose of dividing up and inserting fuses in the feeders and distributors, so that in the case of a branch main developing a fault, that particular section only will be automatically isolated. The houses will be connected with the mains by means of twin cables insulated with bitumen, and the whole will be steel-armoured. The overhead mains will consist of bare copper wire supported on insulators fixed to steel poles 40 yards apart. Houses will receive their light by bare copper strained from the nearest pole to insulators fixed on to the dwellings. The company propose to at once extend the overhead mains beyond the compulsory area, and erect these in Park Road, Newbattle Road and Waverley Road, in the Eskbank district. A suitable site has been secured by the company in Croft Street for the generating station. The details will come before the next meeting of the electric-lighting committee.

IN the Court of Appeal, composed of Lords Justices Vaughan Williams, Stirling and Cozens-Hardy, a considered judgment was delivered in the case of Ferranti *v* the British Thomson-Houston Company, Ltd., on the appeal of the plaintiff, Mr S. Z. de Ferranti, electrical engineer, of Hollinwood, from a decision of Mr. Justice Swinfen Eady giving judgment for defendants, who carry on business at Rugby. Plaintiff's action against defendants was for alleged infringement of a patent for improvements in metres for measuring electricity. The difficulty which Mr. Ferranti applied himself to was to get some method by which slight friction could be overcome so as to allow a metre to start with only a small load of lights on. What Mr. Ferranti did was to reinforce by a constant factor the power of the stationary field, the constant factor being outside any immediate influence upon the lamp currents. Plaintiff's case was that defendants had infringed his patent in having in a Watt metre, which measured both pressure and current, using a little coil which had exactly the same effect or general influence as the coil which was invented by the plaintiff for giving a constant reinforcing power to the stationary part of the magnetic field by a constant factor independent of the lamp current. Mr Justice Swinfen Eady held that on the construction of plaintiff's complete specification defendants had not infringed plaintiff's patent. Hence the present appeal of the plaintiff. Lord Justice Stirling read the judgment of the court, holding that defendants had not infringed plaintiff's patent, and dismissing the appeal with costs.

**BUILDING AND BUILDERS.**

THE Wesleyans of Gorse Hill, Stretford, Manchester, have secured a site in Chester Road for building a mission church.

IT has been decided to erect a new Wesleyan church at Carlisle at a cost of from 12,000*l.* to 14,000*l.*

THE memorial-stone was laid on the 13th inst. of a new United Free church at Cleland. The church, which is nearing completion on a site in Carfin Road, will be seated for 460, and the total cost (which also covers the erection of a church hall) will be 2,000*l.*

THE half-yearly general meeting of the Lancashire, Cheshire and North Wales Building Trades Employers' Federation was held on the 10th inst. at the Mosley Hotel, Piccadilly, Manchester, when Mr. George Macfarlane, of

175, 176 SLOANE STREET, S.W.

ALSO AT LIVERPOOL, MANCHESTER, PARIS, AND CAPE TOWN.

Manchester, the president of the Federation, was in the chair, and there were present Messrs. Samuel Smethurst, of Oldham, H. Lever, A. G. White and W. Tomkinson, of Liverpool, T. H. Kellett, of Preston, James Storrs, of Stalybridge, and about fifty other representatives from all the important towns of Lancashire and Cheshire. The Chairman congratulated the members on the continued success of the Society, and said he hoped that no efforts would be spared to strengthen and extend its influence. They had at present a membership of nearly 2,000, but he hoped that measures that were down for their consideration that day would have the result of nearly doubling that membership, and thus forming one of the strongest building trades employers' organisations in the country. Many matters of trade interest were discussed. In the evening the annual dinner of the Federation was held. Mr. Macfarlane again presided.

SOME ten days ago the operative plasterers engaged on the extension of the buildings at Marle Hall, near Llandudno, which are being carried out for the Birmingham Hospital Saturday Fund by a Birmingham firm of builders, gave notice for an increase of wages, and notified their employer that unless the demand was granted they should cease work. The demand, which was in effect to raise the standard rate payable in the Llandudno district to the standard rate payable in the Birmingham district, was refused, and as a consequence the men struck, and the progress of the work will consequently be delayed, and especially so should the weather remain open. The men, it is said, are acting under the instructions of the executive council of the National Association of Operative Plasterers, and contend that inasmuch as the work at Marle Hall is being carried out by a Birmingham firm the rate of wages recognised as the standard in Birmingham ought to be paid. The employers repudiate the demand, and point out that the operatives were engaged at the job and come from the district. It is further pointed out that plasterers employed by local firms and the operatives in the other branches of the trade are content to work for the standard rate of pay for Llandudno and the district. Unless the men come to a reasonable understanding the completion of the convalescent home extensions will be considerably interfered with.

THE plans for the projected extension of the docks at Dunkirk, which have already been voted by the Chamber of Deputies, have been laid before the Senate. These plans comprise the lengthening of Nos 3 and 4 basins of the Freycinet Docks, by which a mile of quays, with a depth of 26 feet of

water, will be added to the existing accommodation, the removal of the western fortifications, and the acquisition of ground for further extension of the docks. The Chief Engineer of the Ports et Chaussées of the port points out to the Senate that the project will enable Dunkirk to afford the accommodation urgently required for the growing trade of the port, and to provide for further extensions, the necessity of which is already foreseen. The increase of tonnage in 1901 amounted to 202,000 tons, and this would have been still greater had the port been able to provide berths for several lines of steamers which had applied for room. The new quays will accommodate five or six new lines of steamers besides providing berths for outside boats. As regards the military side of the question, the fortifications to the west of the town will be replaced by a large fort, to be built near the shore to the westward of the place destined for future dock extension, and a second fort to the south-west, at the head of a new moat for defensive purposes, leading to the sea front. The outlay on military works will be 11,250,000 fr., and that affecting the port 12,000,000 fr., of which sum the Chamber of Commerce and the Municipality of Dunkirk offer to bear 8,220,000 fr., or over two-thirds of the estimated expenditure.

A NEW church is now in course of erection on Silver Road, at a point just opposite Knowsley Road, Norwich, and the foundation-stone was laid on the 1st inst. by Sir Samuel Hoare, Bart., M.P. According to the designs of the architect, Mr. A. J. Lacey, the new church, which will be dedicated to St. Mary Magdalene, will consist of nave with four bays, and possibly even five, north and south aisles, western porch and baptistery, a chancel of two bays and clergy and choir vestries, with heating chamber under one of them. For monetary reasons, it is not intended to carry out the whole of the scheme at once. The tender accepted comes to something under 3,000l., towards which sum 1,000l. has been contributed from the Bishop's Fund. At present all that is intended is to build the chancel and two bays of the nave, leaving out the vestries. For the present also the benches will be omitted, and chairs will be used for the seating. The design of the structure may be described as of Later Perpendicular style. The walls will be built of brick and blue lias stone lime, faced externally with local flints and Monk's Park stone. The roof will be of pitch pine, while the nave roof will be covered with Broseley tiles and the aisles with Cumberland green slates. The walls internally will be stuccoed. The floors under the seating will be laid solidly upon coke breeze

concrete, the paths of the nave will be laid with encaustic tiles and the chancel and sanctuary floors with encaustic tiles of a better quality. There will be a fine east window, consisting of five lights, which has been designed in the anticipation that some day it will be filled with stained glass. The other windows will be glazed with cathedral glass. A tower does not enter into the building scheme, but a bell gable will be erected at the west end, when the remaining bays of the nave are completed. The church when finished will accommodate 500 worshippers, which is 150 more than the portions to be built forthwith will contain.

### VARIETIES.

THE Bishop of Durham recently opened and dedicated the newly-erected Seamen's Mission Hall in Church Street, West Hartlepool, just completed at a cost of 5,500l.

AN hotel building has just collapsed in Sheffield. Extensive alterations were proceeding at West End Hotel, Glossop Road, and as the premises showed signs of insecurity the customers hurriedly left, the landlord and family also quitting the building. The anticipated collapse eventually came with a tremendous crash, the premises being a mere heap of ruins. No one was injured, but the landlord sustained a heavy loss by the destruction of his furniture.

AFTER extensive restoration Little Marlow Church, Bucks, has been reopened. The remarkably fine fourteenth-century roofs in the two aisles and the chantry (or Ledewich chapel) have been discovered rather than, in the common sense of the word, "restored." The oak casing introduced has been fixed between the tiles and the old timbers, so that the beautiful appearance of the old roofs is perfectly exposed. Several relics of the pre-Reformation period have been recovered and carefully dealt with, and the whole church is rendered ecclesiastically beautiful in appearance.

MR. WILLIAM LE QUEUX, who is making some important excavations of Roman remains at Castor, Northamptonshire, recently made an interesting discovery in a field close to the remains of the ancient Ermine Street, viz the floor and boundary walls of a temple believed to be dedicated to Jupiter. The floor is 40 feet long by 20 feet wide, beautifully tessellated in a design of white and red, and is in perfect preservation. Quantities of brilliant red fresco have been dug out, together with bones, ashes, Roman pottery and glass. In the centre of

the floor is a large pear-shaped hollow, about 2 feet deep and 10 feet wide, in the centre of which are remains of the base of the altar.

SOME very old buildings situate at the corner of High Street and Ely Street, Stratford-on-Avon, are being reconstructed, and the workmen excavating beneath a floor discovered a quantity of elaborately-carved and moulded stones. These have just been examined and found to consist of massive window tracery of Geometrical design. It is the opinion of several persons who have inspected the stones that they probably belonged to the original chapel of the Guild of the Holy Cross, which was erected in the year 1269 by Robert de Stratford. The chapel was situated near to the spot where the discovery has been made, and was taken down towards the end of the reign of Henry VII. (about 1503) when the present guild chapel was built on the same site by Sir Hugh Clopton. The buildings undergoing alterations are of that date, and the stones were doubtless carried there by the builders and used in the foundations.

SOME interesting discoveries have been made during the progress of some restorations at Alphamstone Church, Essex. When the old plaster was scraped off one of the chancel walls was found to be built, not of flint like the others, but of red bricks, with here and there white stones of various shapes and sizes. One of these being extracted, it was found, although somewhat damaged, to be beautifully moulded on the inner side. Large numbers of similar stones have been removed, and the work is still in progress. Practically all of the stones which originally formed the sedilia have been recovered, besides numbers of others which form portions of the tracery of what was apparently a fine window. Five small inscriptions have been found on these stones which, it is hoped, may be deciphered. Alphamstone Church is of great antiquity, and is of especial interest apart from these discoveries. It has an unusually fine chancel arch, which until the present work was begun was entirely covered with plaster. The font, which is believed to be 700 years old, was likewise plastered.

AT the third sessional papers meeting of the Manchester Society of Architects, held on the 11th inst., Mr. P. S. Worthington contributed an interesting paper on "Homes of the Monks during the Middle Ages." Mr. Worthington, who has been fortunate enough to visit many of the principal abbeys and monastic remains at home and abroad, dealt with the subject from an architectural point of view, and showed him-

seif well able to prove his contention that brilliant as were other epochs in architectural history, the results of the eleventh, twelfth, thirteenth and fourteenth centuries stood completely by themselves and appealed as a whole to Northern minds more than any other four consecutive centuries in the world's history. With regard to the general arrangement of the buildings in connection with some of the abbeys, the speaker said that modern architects could scarcely suggest an improvement. Fourteen sets of designs for the students' monthly competition were on exhibition. The subject was a cottage hospital. The prize in the Senior Division was awarded to Mr. C. Birchenall, and in the Junior to Mr. G. L. Cockrell, while Mr. T. H. Hill's design received honourable mention.

IN the course of a careful restoration of the ancient church of Castle Donington, Notts, several interesting discoveries were made, including two recesses, one on either side of the chancel arch and adjoining the choir. These have been partially built up for the purposes of adding to the strength of the columns. A hagioscope was also reopened, giving a view from the south door to the Communion table. An ancient doorway on the north side of the chancel has also come to light. The new oaken door on the south side is included in the restoration scheme. An ancient piscina was discovered quite accidentally during the operations, whilst the sedilia has been so restored as to be ready for use by the clergy when necessary. As far as possible the walls have been pointed within and without, and faced with plaster on the interior. A curious small window, immediately over the hagioscope, is shortly to be replaced by a stained light representing the Nativity. By far the most striking feature of the whole of the restoration scheme is the magnificent stained window which occupies a commanding position at the eastern end of the building. The total cost of the restoration is approximately 2,000l.

THE new Wesleyan mission hall in Cowley Road (City Road) Walton, Lincs, has been formally opened. An offshoot of the County Road chapel, it stands in the centre of a large new neighbourhood, and has seating accommodation for 400 people. The premises are situate between Cowley Road and Bodmin Road on a plot of freehold land acquired by the trustees a few years ago. The building comprises:—Hall, 48 feet by 28 feet, with two transepts 16 feet by 12 feet each; a schoolroom or lecture hall, 30 feet by 23 feet; minister's vestry, 16 feet by 13 feet; ladies' cloak-room, with conveniences, also scullery fitted with sink, boiler, &c. There are three cellars for coals, heating apparatus and storage. The whole

is brick built. The frontages to the main roads are faced with Enfield pressed bricks. The internal woodwork is of pitch pine, varnished. The principal entrance is from Cowley Road, where there are porch and vestibules with tiled floors. There is a separate entrance from Bodmin Road, which will enable the services of the Sunday school and the hall to be carried on apart. The hall is fitted with a neat rostrum of varnished pitch pine, a portion of the panels being fitted with red cloth, giving a pleasant relief. The hall and schools are lighted by reflex pendants. The heating is by low-pressure hot-water Beeston radiators and Mona sectional boiler. The ventilation is by Tobin inlet tubes and roof extractors, the latter being connected with the ceiling gratings by galvanised iron tubing. The whole has been designed by and carried out under the supervision of Mr. H. E. Peach, architect, Southport.

THE new Wesleyan school church which has been erected at Clifton, Yorks, was formally opened on the 11th inst. It will hold a congregation of about 350 persons in a large room 60 feet by 30 feet. There are also two large classrooms at the side, separated by glazed partitions, each accommodating about forty persons; the partitions are removable, so that the space can be used on special occasions or when the congregations are so large as to require the increased accommodation. At the front of the building are two cloak-rooms, which will also be used as classrooms for the Sunday school. Provision is made in the structure for extensions by means of iron girders enabling the brickwork to be knocked out when further classrooms are erected. The building is constructed of brick with stone facings, and of suitable design. The cost, including furnishing, is about 1,800l. The architect is Mr. J. B. Thornley, of Derby, and the contractor Mr. James Cooper, of Rotherham. The site embraces 2,088 yards of land, one-third of which is being utilised for the school premises, and it is hoped in the near future to build on the remaining two-thirds a church for the requirements of a rapidly increasing populous district, at a probable cost of 3,000l.

they were in the happy position of being able to elect all the candidates for the pension who were eligible to receive it. Such a satisfactory condition of things should largely stimulate the inflow of subscriptions, which are much needed for the extension of the beneficent aid afforded by the Institution.

## THE BRITISH SANITARY COMPANY'S NEW AND IMPROVED EARTH CLOSET.

THE advantages of the earth closet in rural districts or lonely situations are sufficiently obvious, but one disadvantage appertaining to those hitherto brought into requisition is that the earth used must be not only in a state of fine division, but perfectly dry, which is not easily attainable nor wholly free from objection on the score of dust arising when in use. In order to get over the difficulty, and to induce the more general adoption of the dry earth closet, the British Sanitary Company, of Bothwell Street, Glasgow, introduce their new and improved earth closet to architects, builders, sanitary engineers and the public generally, as the most perfect appliance of the kind in existence. The advantages thereof are thus summarised:—

1. The simplicity, strength and perfection of the mechanism. The mechanism being bushed with brass, it cannot corrode or get out of order.

2. The effective distribution of the deodorising material thoroughly covers and absorbs all offensive matter and smells.

3. The large capacity of the containing magazine holding the earth or other deodorising material, providing for fifty charges

4. The very moderate price it can be sold at as compared with other closets not possessing the above advantages.

It may be mentioned also that there is no valve to clog and get out of order, as in other closets, while the perforated shovel acts as a spreader, thus insuring certain action and equal distribution of the deodorant.

The various awards from sanitary and other exhibitions testify that the closet is based on sound and scientific principles, while the fact that large numbers are in daily use on the estates of numerous noblemen and gentlemen, as well as in public institutions, works, railways, lighthouses, steamships, &c., affords abundant evidence that the appliance is one that may be relied upon and is already much appreciated.

A reference to the illustration will explain the nature and working of this closet. A is a magazine for containing the dry earth or other deodorising material used. B and B' are the sustaining pieces to bear up the weight of the material, and also form the regulating orifice. C is a bevelled shelf which is lined with a metallic plate, and carries in front an iron frame or mouthpiece through which the perforated shovel or spreader

D travels. The action is communicated as follows:—When the closet is being used the seat is depressed about an inch, forcing down the rods EE on each side of the seat, which raise the long and weighted end of the segmental toothed levers G and G, which in turn throw back the long end of the lever H. This duplex action is coupled by the cross bar J, to which is attached the shovel D. This is then withdrawn to the back of the bevelled shelf C, and receives the charge of earth, &c. When the seat is relieved the weight of the lever brings out the shovel quickly, thus spreading the earth, &c., over the excreta.

Mr. J. Balfour-Browne proposed "The Institution of Electrical Engineers."

The President, who replied, said that the engineers had secured a permanent civilisation to the world. Had the engineers of the old world not only been that but priests, the people of the earth would have been greatly more advanced than at present. He suggested that the really important affairs of the world should be governed by engineers.

Mr. Robert Hammond proposed "The Law."

Lord Justice Cozens-Hardy, in response, said that Parliament had made them free of the Crown and the Executive, but their real strength lay in the confidence of their fellow citizens. He trusted he might be pardoned if he confessed that they sometimes suffered at the hands of the scientist, and he suggested that at times the length of patent cases might be reduced.

### MADRAS HARBOUR.

IN May last the Secretary of State for India appointed a committee of experts, consisting of Mr. C. S. Nares, Mr. C. A. Hartley and Mr. W. Matthews, to report whether the proposals which had been submitted to his lordship for the improvement of Madras harbour, and to prevent, if possible, the existing liability to serious damage from cyclones "are generally feasible and suitable in the conditions of the harbour including the progressive accumulation of sand to the south of it." The full terms of the report of the committee have now been published by the *Madras Mail*. The scheme submitted provided for the opening of a new north entrance and the closing thereafter of the existing eastern entrance, the new entrance to be 400 feet in width and to be protected seaward by the construction of a breakwater arm, 1,600 feet in length, commencing at the outer portion of the curve in the existing north pier and extending therefrom in a direction practically parallel with the shore line. It was further proposed that the centre of the new north entrance should be placed at a distance of 820 feet shoreward of the inner face of the protecting arm. The project was framed by Mr. de Winton, the chief engineer to the Madras Government, who estimated the cost at 196,667*l*. The committee pronounce unhesitatingly in favour of the principle of the proposal, being of opinion that whilst the eastern entrance remains open the harbour must unquestionably be deficient in shelter, and on the occasion of

cyclones might even be dangerous to vessels lying within its area. They consider that there is no satisfactory mode by which the existing entrance can be effectively or sufficiently protected, either by a sheltering arm in connection with the south pier or by isolated moles or otherwise, without at the same time creating such difficulties with regard to the navigation of the entrance and other matters as would render the adoption of such expedients altogether inadmissible. Difficulties will have to be encountered in carrying out the scheme, but the committee see no other effective method of dealing with the local conditions of the site, including that of the growth of sand and its inevitable travel northwards. Subject to certain modifications on points of detail and not affecting the principle of the scheme, the committee recommend its adoption, and believe that if the works are effectively carried out the harbour will be rendered sufficiently quiet for the safe and convenient berthing of vessels under all conditions of weather.

### SCOTTISH MUNICIPAL ENGINEERS.

THE half-yearly meeting of the Scottish Association of Municipal Engineers and Surveyors was held in the Burgh Court Hall, Glasgow, on the 13th inst., Mr. A. B. McDonald, city engineer, Glasgow, the president, in the chair.

Lord Provost Primrose welcomed the members on behalf of the Corporation. He understood that the Association was quite in its youth yet, only having been founded about a year ago on similar lines to a parallel institution in England. He believed he was correctly informed when he said there was some desire that they should have amalgamated and made one national association. He saw from the agenda that a paper was to be submitted on "Viagraph Tests of Street Paving." He thought at first it might be some new departure in street paving. On inquiry, however, he found it was only a machine that was drawn along the roads and automatically registered inequalities. It suggested to his mind one matter to which engineers and surveyors might profitably direct their attention, the paving of great cities; for nothing more awful than the noise of Glasgow was to his mind conceivable. Calm reflection was very difficult when traversing the streets, and even when they were inside their offices and business chambers the noise passed through all obstructions of stone and lime and glass, and they had often

within their chambers on leading thoroughfares a very inferno of noise. That some profitable work might be done in that direction he earnestly trusted. They must admit that in London conditions were very much better; notwithstanding the enormous traffic there was something like decent quiet even in the heart of the City where traffic was heaviest. He could not conceive that it was beyond the ability of engineers to ultimately effect a reform in our city. If this were brought about it would be hailed with gladness by every citizen. He trusted that the intercourse of the members would be profitable to themselves, and by reflex action influence profitably the communities represented.

Baillie Stevenson, as senior magistrate, supplemented the welcome of the Lord Provost.

The President said that the Lord Provost and his magisterial colleagues were obliged to go away to attend a meeting which had been arranged some time ago. He thought that it would be improper if they were allowed to depart without the thanks of the Association being accorded them for their kindly welcome. He moved accordingly.

The resolution was cordially approved.

The meeting unanimously adopted an alteration in the constitution as follows:—"Admission as members may be extended to principal assistants not under twenty-five years of age, and having special qualifications."

Mr. Thomas Aitken, county surveyor, Cupar Fife, read a paper on "Viagraph Tests of Street Paving." He explained that the viagraph is an instrument designed to give autographic records of the unevenness of paved streets and macadamised roads. Originally the intention was to apply it to macadamised roads only in order to compare what was considered the unsatisfactory state of the roads in Ireland with those in Great Britain. But it had been made suitable for all classes of roads. A length of 88 yards, 1-20th of a mile, was convenient, and was measured off automatically in using the instrument by apparatus inside the profile drum round which the paper passed from the stock roll to the receiving drum. The machine could be used as a sledge or slider, and also had a serrated wheel which rose or fell to correspond with the unevenness of the road. The best result attained in asphaltic pavements so far tested was in Cochrane Street, Glasgow, formed of seyssell, and laid in August 1902, the surface giving 6.7 feet of unevenness per slider per mile. In Wilson Street, Glasgow (Alcatraz, 1899), from Brunswick Street, going westwards, the record was 11.3 feet; in Brunswick Street

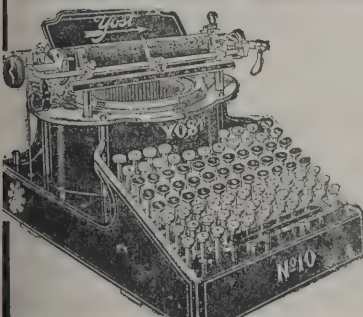

(Limmer, October 1902), from Ingram Street, going southwards, 13.25 feet; while in George Square (Alcatraz, 1902), in front of the City Chambers, the unevenness amounted to 17.95 feet per mile. In wood-paving in Buchanan Street, Glasgow (March 1902), a piece of newly laid wood pavement gave a record of 19 feet, while in the same street on a similar pavement, but laid three years ago, the unevenness was found to be 31.1 feet. Sett-paved streets generally did not give, as might be expected, a good example of smooth surface. However, to make the comparison as complete as possible, several profiles had been taken in Glasgow. In Grove Street, which was paved with square whin in 1888, a portion gave a record of 36.0 feet with the slider and 43.6 with the wheel; while in Cedar Street, paved with whin setts in 1902, the unevenness was 53.7 with the slider and 98.0 with the wheel. In Wilson Street, from Brunswick Street towards Candleriggs Street, the result was comparatively high, varying from 10.41 of unevenness with the slider to 21.61 with the wheel.

The President explained that the examples given were not to be taken as a general index of the streets of Glasgow.

Mr. Turnbull, Greenock, said that the irregularities of roads had been regarded with considerable interest by different corporations, and it was therefore desirable that surveyors should have some convenient and easy method of testing the unevenness and comparing it with the traffic.

Mr. F. G. Holmes, Govan, thought that the instrument might be a most valuable one for corporations to have in certain instances. Speaking generally, however, he was a little doubtful of its utility, because when roads got into such a condition as to require radical repair that would be evident without the use of the viagraph. A good-going ward committee would be quite able to keep a surveyor up to his work. If, however, a machine could be invented which would give some idea of the life of a street or of the materials used in road-making it would be of great service. Streets in populous centres, such as Glasgow, Govan, Partick and all great engineering centres, were subject to enormous weights passing over them. They had been told that in Liverpool at the docks some of the paving materials took fifty years to wear an inch, but of course one could understand that in five years there might be as much in subsidence owing to the passage of heavy weights. He did not know there was a more reliable way of testing the life of material than by weighing the stones, as had been done in Liverpool.

Mr. John Bryce, Partick, thought that such a test as that

of the viagraph could only be of use when it was read in conjunction with a record of the traffic. As good a way as any of testing the smoothness of a street was to ride rapidly over it on a bicycle. There was no doubt that the demand for smooth pavements arose from the awful noise of the streets. But seeing that rubber tyres were now being used for many classes of vehicles, the noise might in time largely disappear. There could not be anything better in the way of material than granite setts well grouted.

Mr. John Young, general manager Glasgow tramway department, did not know there would be much use to the machine until the streets were more perfect than at present.

Mr. James Murray, Paisley, considered that the machine would prove of great use in testing the irregularities of sewers, which could not at present be learned until perhaps something serious had happened.

The President said that when people talked of the noisiness of Glasgow streets as compared with those of London they forgot the different manner in which the horses were shod in the two places. If London horses were shod in the same way as the Glasgow horses, the short life of the wood paving would be such as to compel the authorities to adopt the same paving as in Glasgow.

Mr. Aitken was cordially thanked for his paper.

Mr. John Young, town surveyor, Ayr, read "Notes on the Design and Construction of Power Stations."

### PETROLEUM BRIQUETTES.

BRIQUETTES made with petroleum have been manufactured in various ways in different countries, notably in Russia, France and the United States, as a combustible for steamships and for certain industries where rapid production of heat is desirable. The advantages of such a substitute for coal are readily apparent—less storage room, complete combustion, &c. It is surprising, says Consul Brunot, of St. Etienne, that petroleum has not been utilised more generally in this form. The objections are that the briquettes injured the boilers after a short time by reason of some chemical action produced by combustion; further, the blocks did not keep their form under the action of the heat, but fell through the fire-box in a liquid state, and the price is said to be two-thirds more than that of coal. A company has recently been formed at St. Etienne for the manufacture of petroleum briquettes which

claims to have obviated all the objections except that in regard to price. The advantages of the product are set forth as follows:—The briquette is composed of 97 per cent. of petroleum and 3 per cent. of hydro-carbon. The volume being equal, it weighs only half as much as coal, and gives but from 2 to 3 per cent. of residue; it produces no slag; it does "run" when lighted, and keeps its form like coal; it burns without odour and without smoke; it may be wetted with impunity, losing none of its properties; it consumes without explosion or sparks, and yet with a bright and long flame; it may be kept indefinitely without deterioration. By this process a degree of saponification is obtained by which the briquettes are rendered unchangeable even to the extent that if a projectile should enter a ship's bunker filled with this fuel there would be no danger whatever of explosion, the effect being the same as in the case of ordinary coal. The average heating power is from 12,000 to 14,000 calories, and the briquettes can be employed in any fire-box or in any grate for domestic purposes. The manufacture of these briquettes is very simple, and requires but little machinery. If necessary, the petroleum contained therein can be recovered with a loss of only 5 to 7 per cent. The same company manufactures what are called mixed briquettes—half coal and half petroleum; but if these are cheaper than the former they present less advantages from the fact that the density is greater and the heating power is only 9,000 calories. A steamer carrying 8,000 tons of coal would require 3,500 tons of mixed briquettes, and only 2,500 of the pure petroleum briquettes.

### THE COTTANCIN SYSTEM OF REINFORCED CONSTRUCTION.

THE ceremony of laying the commemoration-stones of the new Wesleyan church of St. Sidwell's, at Exeter, on December 3, has drawn considerable attention to the interesting system of construction being employed for the first time in England in the building of this church. This system, which is well known and largely employed in France, but has only recently attracted attention in England, is called the Cottancin system of steel-cored brick and steel-cored cement construction. This system, which has the advantage of being absolutely fireproof, for the steel core employed is so small that even great heat has no effect on it when embedded in cement, and no dislocation

can occur as is the case when steel elements of larger diameter are employed, is also very advantageous in point of view of economy in cost of construction, solidity and durability, adaptability to the many problems of modern building construction, the suppression of numerous points of support and consequent economy in space, and the entire suppression of all timber for construction of floors and roofs.

The interesting points in the construction of the above church are the steel-cored brick caisson foundations, the steel-cored brick hollow walls, the reinforced cement gallery and the important octagonal dome with lantern and cupola above. The foundations and lower portion of the building already completed have been constructed of steel-cored brick caissons, the foundations of this system, about 3 feet deep only, replacing the ordinary deep foundations of concrete with the usual brick or masonry footings. The caisson foundations, largely employed in cases where the soil is soft or treacherous, are formed of a series of partitions of steel-cored brick 3 inches thick and about 3 feet deep, forming by their intersections one with another a number of large boxes of unequal dimensions and shape designed to meet the strains from the building above. These boxes, when completed to a certain level, are filled in with earth and covered entirely with panels of steel-cored cement about 2 inches thick, the trellis core of which is tied in a special manner to the steel wire cores projecting from the brick partitions. Such caisson foundations, which have been largely employed to carry very heavy buildings on soft soil, and even mud in several cases, are unable by the nature of their form to settle or slide in one or any portion, for the resistance afforded by the strong cement cover and the friction of the brick partitions against the earth counteracts any tendency to settle or slide. The economy in cost of foundations obtained by the employment of this system when the ground is soft is very great when compared with the cost of the deep masonry or concrete foundations necessary in such cases, often obliging excavation to very great depths against the 3 or 4 feet depth only required for these caisson foundations. In the case of the above church these caisson foundations were not employed for the sake of any economy to be obtained in the foundations themselves, but on account of the economy which could be obtained by their use in suppressing the expensive and heavy steelwork which would otherwise have been employed from ground to roof for supporting the wide gallery and domed roof and cupola. The walls of the church are being constructed of steel-cored brick in two thicknesses of 3 inches with air space

between, which will be utilised for heating and ventilation purposes, and have the advantage of keeping the interior cool in summer and making it easier to heat in winter. These steel-cored brick walls, as well as the partitions of the caisson foundations, are formed of a special hollow brick, through which pass vertical and horizontal cores of soft steel wire carefully embedded in the cement employed to fill the hollows of the bricks and the horizontal joints of the brickwork, and thus well protected from the influences of oxidation. The important gallery, 14 feet wide, which will go round six of the eight sides of the octagonal building, will be formed of steel-cored cement, supported by reinforcing ribs of steel-cored brick and steel-cored cement. This gallery will be suspended from the walls only, and will be entirely unsupported by any columns from below or tie-rods from above. The octagonal domed roof will be constructed of two thicknesses with air space between, the inner surface being formed of steel-cored brick and the outer surface exposed to the weather being formed of steel-cored cement finished in cement. The wide octagonal lantern, with root and cupola above, at a height of about 80 feet, will be constructed on the same system, all timber being suppressed in the construction of the roof as well as for the gallery and staircases leading from the gallery. No zinc or lead will be employed for the construction of the gutters, flashings or flats; all these will be formed of cement and will afford a considerable economy in the maintenance of the roof. The steel core, which passes without discontinuity from the foundations through the walls, gallery, floors, roof and lantern, will form a whole of extraordinary strength and resistance. This system is largely employed in France for the construction of all kinds of buildings, from works and factories to châteaux, churches, theatres, country houses and street houses. One of the latest buildings entirely constructed on this system is that of the seven-storey house in the Avenue Rapp, Paris, which received this year the premium awarded by the Paris Municipality, and has been illustrated in several of the English journals. The architects of the church at Exeter are Messrs. Fred. J. Commin & Walter Coles, of Exeter; the system of construction has been accepted and passed by the streets committee on the report of Mr. Thomas Moulding, C.E., city surveyor, and approved by the City Council. The whole work of construction is being undertaken by the Cottancin Construction Company and the labour employed is entirely local under an experienced foreman. The cost of the constructional portion of the work will be 3,000

### PRODUCTION OF IRON IN AMERICA.

A PAPER was read at the second meeting of the session in connection with the Staffordshire Iron and Steel Institute by Professor Turner, of Birmingham University and a former president of the Institute, entitled "Some Notes on a Visit to Pennsylvania in the Summer of 1902." Professor Turner at the outset referred to the important extensions in progress in connection with the University of Birmingham, and remarked that it was intended that shortly there would be in working operation a metallurgical department on a more complete scale than had hitherto been attempted in this country. In connection with the preparation of the plans for this part of the work Professor Redmayne and he visited certain representative universities and technical schools in Canada and the United States. The visit was necessarily brief, but the opportunity was taken by Professor Redmayne to visit certain representative mining operations, while he (Professor Turner) visited works in which electro-metallurgical and refining processes were conducted, and also spent a short time in Michigan and Western Pennsylvania. So much had been heard from time to time of the extreme purity and easy reducibility of American ores that it might be well to point out that ores of equal purity were to be obtained in this country, and ores, too, which could be quite as easily smelted in the blast furnace. The important questions, when comparing the two countries, were less those of quality than of quantity and distance, and we were apt to attach too much importance at times to the immense mineral resources of the United States and too little to the energy, industry, perseverance and skill of the people. With the development of the bituminous coalfield of Western Pennsylvania and the opening up of the iron-ore regions of Lake Superior during the last quarter of the nineteenth century it had been seen that ready and cheap transport was of greater importance than contiguity of supplies. The enormous quantities of material which were available allowed the question of transport to be dealt with in a comprehensive and masterly way, which again reacted on the size, capacity and output of the works in such a manner that a modern ironworks became a centre to which were collected materials of all kinds, assembled from far-distant localities, and at which were to be seen examples of the best engineering practice of the day. It was in this way that the at one time apparently insuperable difficulty of distance led to an enormous expansion of the iron trade in Pennsylvania, and to the erection of immense plants which

had served as models in many important respects for the whole world. In round figures, something like four-fifths of the iron ore raised in the United States was obtained from the Lake Superior region. The ore was deposited by the steam-shovels at the mines in huge hopper cars, and was conveyed by special locomotives to lake steamers, on which it passed through Lake Huron to Lake Erie, and was unloaded at Cleveland or other ports on the south side of the lake. The ore was then transferred to hopper cars, which travelled by special freight lines to their destination. It was claimed that more tonnage now passed Detroit than crossed the Atlantic Ocean. The loaded car was run on to a balanced frame, on which it was gripped, while the frame moved through the arc of a circle, and the whole car was bodily emptied. Where this tipping apparatus was not employed double hopper cars were used, and one man could empty four cars, or about 200 tons of ore, per day of twenty-four hours. A train of these cars conveyed from 2,500 to 3,000 tons of ore in the usual course, and the cars generally conveyed coal back to the lake ports. Professor Turner proceeded to give some description of the works of Homestead, Duquesne and Edgar-Thompson, belonging to the Carnegie Company. The average coke consumption at the Edgar-Thompson blast-furnace plant was about 1,900 lbs. per ton of pig-iron produced, but with good coke and best working a ton of pig-iron was produced with about 1,750 lbs. of coke. Careful records were kept of the production and coke consumption of each furnace, and these records were circulated among the managers of the various plants, and no doubt this stimulated healthy competition. The largest recorded monthly output of a single furnace to date was made in May 1902 by the Edgar-Thompson E furnace, the produce being no less than 20,188 tons. Looking back on the impressions of his brief visit, three things appeared to Professor Turner to be worthy of special remark. Of these, first and most interesting was the people. It was true that in the manufacturing centres of America there were to be found a large proportion of negroes, Italians and Hungarians, not to mention those of Teutonic or British extraction; but, speaking generally, the leading positions were occupied by men who were American born, and those of other races, in the first place at all events, were merely day labourers. Those who were really responsible for the conduct of these vast enterprises were usually thin, lithe, active, keen, clean-shaven, young-looking men, who worked twelve hours a day six days a week, who took little alcohol, but often consumed a good deal of tobacco,

Excelsior and Rawdon Potteries,

who always had an eye to the main end in view, who led "the strenuous life," and yet who had always a frank and courteous reception for a stranger. But perhaps nothing about them was more striking than their buoyant self-confidence, which was based upon their acknowledged success in the past, and which was, after all, the best guarantee of success in the future. Secondly, distance exerted a most important influence. If the United States be compared, area for area, with other parts of the world it was doubtful whether the provisions of nature were any more bountiful on one side of the Atlantic than the other. The difference appeared to be that in America we had to deal with a comparatively new country, where the national resources were being exploited as rapidly in one year as in ten years in an older land. The difficulty of transport having been once overcome, the mineral resources of immense areas were rendered available, so the furnaces were no longer restricted for their raw materials to the products of a particular district or confined in their markets to a local area. It thus became possible to plan works on a scale limited merely by the capital available, and to adopt mechanical contrivances and economies which would be impossible by less gigantic undertakings. Distance had thus almost ceased to be a disadvantage, but acted beneficially in increasing the total volume of trade and in diminishing the natural fluctuations of the market. Finally, the educational system of Canada and the United States called for remark. Faith in the utility and necessity of education was firmly fixed in the American people. Wealthy citizens were prepared to subscribe with more than princely liberality to the cause, parents were willing to make heavy sacrifices so that their children might be taught, whilst the students themselves were in many cases so enthusiastic that they were prepared to live during the session on the money they were able to earn during the vacation, rather than enter upon their life's work ill prepared. Hence our system of evening-class work found little favour in America, students passing through the primary and secondary schools to the college or university, where four years' were spent in strenuous work. The result was that the students in applied science at the higher centres of learning were numbered by the hundreds at each university, while the course of work was so systematic and thorough that manufacturers recognised that the men thus trained were the best they could obtain in order to direct the most important industrial undertakings, and students who had graduated experienced no difficulty in obtaining suitable employment.

Until a similar condition of affairs existed in this country it could not be suggested that the need of higher technical training had been satisfactorily met.

### EDINBURGH AND LEITH MASTER BUILDERS' DINNER.

THE annual dinner in connection with the Edinburgh and Leith Master Builders' Association took place on the 11th inst. in the Royal British Hotel, Princes Street, Edinburgh. About 130 gentlemen were present. Mr. Robert Lamb, president of the Association, occupied the chair, and Messrs. Knox and M'Leod and Councillor Forrest acted as croupiers. The loyal toasts were proposed from the chair, and enthusiastically pledged.

Mr. Patrick Knox, in proposing "The Imperial Forces," expressed surprise that at this time of day it had been necessary to conduct a bazaar to raise funds for the accommodation of one of their Volunteer brigades. It ought to lie with the War Office to provide all that was necessary to make the Volunteers better soldiers.

Treasurer Cranston, in replying, agreed with Mr. Knox in regard to bazaars. He did not believe in them, but in the instance mentioned he had loyally to fall in with the majority. He quoted Lord Rosebery, to the effect that this country went blundering into wars, but always came out right. That was true, but whose was the fault? He did not blame the War Office, but rather successive Governments. There was plenty of raw material to make good soldiers of, but Governments had failed to adapt their system to the increasing needs of the Empire. While people might grumble at the taxes, they paid all the same. He held that under present methods the country only got sixpence for every shilling they spent on the military forces. There was plenty of capital and plenty of patriotism in the country, but if they were to take full advantage of these factors they must reform their machinery.

Mr. James Millar, in proposing "The Lord Provost, Magistrates and Town Councils of Edinburgh and Leith," suggested that the Corporation might undertake the erection of working-class houses, and thus do something to relieve the distress in the building trades. His opinion was that no private individual could build houses for that class of people under the present conditions of the building rules. He also suggested that on inquiries into the housing question evidence

should be taken from builders, architects or house factors, as well as from other experts.

Bailie Bryson, who acknowledged the toast, said that the Town Council of Leith had appointed a committee to deal with the tramway question, and he had no doubt that from the friendly relations which existed between Edinburgh and Leith some way would be found out of the "Pilrig muddle." He was opposed to corporations taxing one class of the population for the housing of another class.

Councillor Dobie, who also replied to the toast, said that if they believed the man in the street and anonymous letter-writers they could come to no other conclusion than that the members of the Town Council were mostly fools. Although the ratepayers were sometimes unwise enough to send a round man to fill a square hole, the majority of the town councillors were men of common sense. In regard to Mr. Millar's remarks as to the building of working-class houses, he said it was matter for consideration whether the proposed cheap electrical transit to the districts surrounding the city might not materially assist the erection of cheap working-class houses. If the proposed electrical tramways were laid, some experiment might be made in the housing question.

Mr. A. Hunter Crawford proposed "The Edinburgh and Leith Master Builders' Association." Speaking of the Dean of Guild Court regulations, he said he would like to hearten the civic authorities in their efforts to get good work put up in Edinburgh. The excellent quality of the building work in Edinburgh had been largely helped by the building regulations. Under these regulations there was in Edinburgh greater freedom in carrying out work than was to be found in other cities. Convener Barton replied.

Mr. James Hall proposed "The Scottish Building Trades Federation." He thought there was no present necessity for working-men's houses. There were 2,581 empty houses in Edinburgh this year, or 350 more than were empty last year. Did that show that more houses were wanted for the poor people? There were empty houses with rents as low as 6%, and there were 1,100 empty houses rented at between 10% and 12%. In the West Port and Tron Square the Corporation had built houses, the tenants in which had come complaining to him that they would not stay in them—they were so cold. If the bricks had been pressed, it would not have been so bad, but they were bricks with irregularities that crows could build their nests in.

Councillor Forrest, who replied, agreed with Mr. Hall that

the demand for workmen's houses was not so great as some people would like to make out. He remarked that the Building Trades Federation had not been taken up so enthusiastically as was to be desired, and he urged that everybody connected with the building trade should come into the combination.

Lord Dean of Guild Bruce proposed "The Architects and Surveyors." He said that the Scottish style of building impressed one too much with its stability and solidity. That was all very well in its way, but he would like to see less of solidity and more of beauty in their elevations. The architects who most succeeded in that respect were sure to be the most successful in their profession. Speaking of Princes Street, he said that the height of the buildings in that street formed one of its attractions, and he hoped that where buildings there required to be heightened it would be done at no distant date. In regard to the Usher Hall—the site for which he thought was the best possible—he trusted that the Town Council would arrange for competitive plans being asked for, so that rising architects might have an opportunity of sending in plans. If that were done, he was sure they would see erected a building that would be an ornament to the city, and a worthy memorial of the generous donor—Mr. Usher.

Mr. Lorne Campbell, in reply, said that architects had not in every case made the best of their opportunities in regard to the æsthetics of the buildings they designed. The Dean of Guild Court had no control over that matter, and he did not know that it would be wise to give the court that control. Most of the architects of Edinburgh were at one with the Lord Dean of Guild as to the propriety of asking competitive plans for the Usher Hall. He thought it would be a slight to the architects of Edinburgh if the designing of the Usher Hall were kept in a city department. A public-spirited man like Mr. Usher would have desired that his scheme should have been carried out in a public-spirited way, and the only way of doing that was to give all the architects of Edinburgh, or the whole of the architects of the kingdom if they liked, a chance of preparing plans for the hall. Edinburgh had a very unenviable reputation in regard to such competitions. On several occasions premiums had been paid for designs and the work had not been proceeded with. The building of the Usher Hall provided an opportunity for Edinburgh redeeming itself in the eyes of architects.

Mr. A. K. Smith replied for the surveyors. Other toasts followed.

# DURESCO

## THE IMPROVED WATER PAINT.

For the Treatment of Walls and Ceilings, either for Plain Work or Artistic Decoration.

Dries Flat and is not Absorbent like Common Distemper.

SEE BOOK OF 28 DESIGNS, by W. J. PEARCE, PRICE 2/6, POST PAID.

## PETRIFYING LIQUID, THE STONE PRESERVATIVE.

This Material has now been extensively used for over Sixteen Years for Arresting Decay in Porous Stone and Brick Buildings, Monuments, &c.

## CHARLTON WHITE (ZINC) OIL PAINT

NON-POISONOUS. CHEAPER THAN WHITE LEAD.

THE SILICATE PAINT CO., J. B. ORR & CO., Ltd., CHARLTON, LONDON, S.E.

# The Architect.

## THE WEEK.

PROFESSOR BOYD-DAWKINS has done useful pioneer's work in endeavouring to clear away the obstacles to our knowledge of early man in Britain. As a practical geologist and palæontologist he might be supposed to be in favour of museums on the grandest scale, and on those only. But last week he delivered a lecture to the members of the Powysland Club, which by itself is enough to show how enthusiastic he is about local museums. At one time, he said, a museum was looked upon as a receptacle for odds and ends of all kinds—such as pickled babies, a five-legged sheep, or a portrait of an alderman which the family did not care to keep in the house. A more worthy notion now prevails, and before long it may be taken for granted that museums will hold an important place in the educational system of England. The obtaining of the objects that were desirable would be impossible without an expenditure of money, and Professor BOYD-DAWKINS declared that it was as much a duty to lay out money on museums as on Board schools. Few who have studied the subject will venture to disagree with the Professor. Looking at the heterogeneous things to be seen in museums, it might easily be imagined that the original English museum was the apothecary's shop which was to be found in London and elsewhere, as well as in Mantua. The hanging tortoise, the stuffed alligator, the skins of ill-shaped fishes have not entirely departed from our institutions. Such things may still have their educational use, but what is more desirable are objects which illustrate local life in past ages, and it may be examples which will help to suggest the exact position of local industries in the European scale.

THE "octroi duties" at the barriers of Paris are now levied very rigorously. This is demonstrated by the increase of this year's returns over those of last year. From January to November the amount has been 95,965,505 francs, against 93,781,677 francs for the corresponding period of 1901. The position of building in comparison with other industries is suggested by the amount for the eleven months derived from the materials employed in construction. The sum was 8,515,919 francs, which was an increase of 947,080 francs over the receipts for a like period last year. About one-twelfth of the octroi duties has, therefore, been levied out of building materials. Owing to the works undertaken during the last forty years in widening streets, building schools, &c., in Paris, the expenditure is now between 13 and 14 millions sterling a year; about one-half of that is derived from octroi duties.

THE Lord Chancellor does not preside in many Courts, and from his own experience cannot be regarded as an authority on their defects. The remarks which were made by his lordship on Saturday at the luncheon which followed the laying of the foundation-stone of the new Sessions House of the Old Bailey must therefore be taken as expressing the conclusions of other judges. They are no less important on that account. His lordship said that in his long experience it had appeared to him that one of the last things that the architect seemed to consider was how people were to hear what was said. The architect was told that he had to make a place for the judge, another for the jury and the witnesses, and so forth, and with great skill and geometrical precision he mapped out all these things; but their relations to each other, whether the witnesses could be heard by the jury, or the jury by the judge, and so on, were things which in a great many Courts never seemed to have been considered. No doubt there had been an advance in acoustic science, as in other directions, and he felt sure that the City lands committee, consisting of so many practical men, would not allow such matters to be lost sight of in the new Court. It would be incorrect to treat the Lord Chancellor's statement as exaggerated. His words should be taken to heart by all architects who have to design buildings in which a speaker has to address many people. But it can be said as some extenuation, that although the phenomena

of sound have received much attention from investigators, very few practical conclusions have been attained. Inclined walls and ceilings, the use of materials that are absorbent, low ceilings, floors laid out on isacoustic curves and the like may appear to be efficient in theory, but buildings arranged in absolute correspondence with those conclusions would be unattractive. Draperies, cushions, &c., which are sometimes found to be advantageous, and sometimes the reverse, are but slightly used in modern Courts. A thorough investigation of the subject is beyond the power of any individual. The Government might for the public benefit, apropos of the Lord Chancellor's observations, appoint a commission in which men of science, architects, theatrical managers, vocalists, actors and public speakers should have places.

ON May 16 we referred to a claim for 10,000*l.* which had been raised by the widow of the late JOHN COOPER, burgh engineer of Edinburgh, against the Corporation of that city for her husband's services as joint engineer for tramways. When Mr. COLAM was appointed he was informed that Mr. COOPER was to be joint engineer, and the commission was to be 5 per cent. on the outlay, which was 600,000*l.* Mr. COLAM drew 15,000*l.* as his share of the commission. It was calculated that after paying 5,000*l.* to Mr. COOPER's assistants, a sum of 10,000*l.* remained, for which the widow sued. Their liability was denied by the Corporation, and it was maintained that as Mr. COOPER was bound to devote his whole time to the duties of his office he was excluded from the performance of other work. Judgment in the case was not given until the 13th inst. Lord STORMONTH-DARLING decided in favour of the Corporation. He said that if the defendants had made such a contract as had been stated it would have been extraordinary and improvident. Mr. COOPER might have refused to share the responsibility for the tramways, although in the public interest it was expedient that he should be conjoined with Mr. COLAM. It was to be regretted that nothing was mentioned about an honorarium, which would have been very different from a commission. Mr. COOPER had never hinted to anyone until he was dying that there was a commission due to him from the Corporation, and he made no claim on the subject. He had accepted an addition of 100*l.* a year to his salary, and a gratuity of 200 guineas, neither of which would have been given if a sum of 10,000*l.* was lying to his credit. Lord STORMONTH-DARLING, in giving judgment for the defendants, expressed the hope that the Corporation would recognise Mr. COOPER's arduous and meritorious labour by awarding a substantial honorarium to his widow. When writing on the subject at the beginning of the litigation, we said that the case was likely to affect the position of municipal engineers. There is no doubt that officers should not be too sanguine about receiving extra remuneration when they undertake extra duties. It is only through a definite agreement in writing that any claims for extraordinary services can be recognised by the Courts.

THE report of the committee appointed in 1901 to consider how far the sections of iron and steel could be made uniform will shortly appear. It is, however, understood that a large reduction in the number of sections will be recommended. Instead of sixty-three sections of channel irons, twenty-three sections are considered to be adequate to meet the requirements of business. The angle irons of unequal sides can without loss be reduced from fifty-nine varieties to thirty. The reduction in beams will be less marked, as instead of forty-nine there will be thirty. No less than seventy-one sections of tram rails are in the market, while all practical needs can be served by five. Great Britain is remarkable for the vast numbers of sections which are rolled. For several of them there is only a limited demand, and it is doubtful in those cases whether the returns meet the cost of production. It is certain that Americans and Germans contrive to compete with this country by means of a limited number of sections, and the superabundance in Great Britain is not obtained without a large expenditure on rollers and tools. The members of the engineering standards committee represent not only producers but users of iron and steel.

## AN ANCIENT ALTAR.

AN assurance of their individual infallibility was one of the characteristics of the old race of archæologists. ARBUTHNOT did not exaggerate the weakness when he wrote his "Memoirs of Martinus Scriblerus." In it we read how the grave Dr. CORNELIUS believed he was possessed of an antique buckler, and in his dissertation concerning it he proved from the colour of the rust its exact chronology. That invaluable piece of antiquity had been purchased at the expense of all the family plate, but was cheap at the price, for it had become famous through the universities of Europe. All Germany was moved to inexpressible grief by its removal, and the great MELCHIOR INSIPIDUS broke his heart over the loss. An ignorant housemaid unfortunately scoured the shield, and in that way removed the beautiful obscurities which were the cause of much delightful disputation, where doubt and uncertainty went hand in hand, and eternally exercised the speculations of the learned. The shield, which was worthy to be the cradle of the Infant HERCULES, suddenly changed into a basin such as a country barber would not hang at his shop door, or, as others said, a paltry old sconce with the nozzle broken off.

After reading of the transformation of the wondrous shield of Dr. CORNELIUS, we might suppose the eighteenth-century antiquarians would display less assurance in describing the meaning of remains of antiquity. But among that class ridicule for once was ineffective. Indeed, we may say that at the present day, although the interest in the past is only of a very subdued kind, there is still extraordinary confidence by individuals in their own conclusions.

We present this week the outlines of an example of ancient art which at one time gave rise to dissertations, but all that is derived from them is a legacy of doubt about the purpose of the object, and the significance of the figures with which it is ornamented. It formed a part of the Borghese Collection, but as it belonged to the Monumenta Gabini which used to be found in the Villa Pinciana, there can be no hesitation about its genuineness as a relic of antiquity. It has been generally taken as an altar. Three kinds were recognised—square, or rather rectangular, round and triangular; the last form was seldom employed. Altars usually bore inscriptions stating the service to which they were devoted, but no clue of that kind is to be seen in the example under consideration. The diversity of character seen in the upper and lower rows of figures is also unusual. It is therefore not surprising that some archæologists have debated whether the work was a true altar and not a pedestal for some purpose in connection with the temple, or it may be the base of a candelabrum. Let us now consider the figures.

Schoolboys remember how "LARS PORSENA of Clusium, by the Nine Gods he swore, That the great house of TARQUIN should suffer wrong no more." The nine divinities were, according to PLINY, those who had had the privilege of employing the thunderbolt as a weapon. But the Etruscans and Romans believed they were in unity with the Greeks in accepting twelve Dii Consentes; in other words, there were superior and inferior deities. The former consisted of six male and six female representatives. At first sight it may not be evident that the upper row presents a god and a goddess alternately, but that is one of the difficulties which it is possible to explain. It must have been perceived at an early time that there was a liability to error in attempting to distinguish between figures which were as perfect in form as a sculptor or painter could make them; hence the introduction of various signs or symbols in order to facilitate identification.

On one face or side of the altar ZEUS or JOVE is recognised from carrying a thunderbolt in his hand. He is talking to or looking towards HERA or JUNO. The Empress of the Sky, the Great Matron of the Thunderer, holds a staff or sceptre, which is suggestive of the sharer of JUPITER's imperial sovereignty. But WINCKELMANN, who considers the altar an Etruscan work, says the figure is especially deserving of notice for another reason, which he thus explains. "She holds with both hands a pair of large tongs, and she was thus represented also by the Greeks. The figure is that of a JUNO MARTIALIS, a warlike JUNO; and the tongs probably contained an allusion to a particular manner of forming the order of battle to make an attack,

which was called *forceps*; and it was a saying, 'To fight like a pair of nippers,' *forcipe let serra proeliari*, when an army so opened in fighting as to enclose the enemy between, and was able to execute the same opening if, whilst engaged in fighting in front, it should be assailed in the rear." It would seem as if WINCKELMANN had fallen into an error and was thinking, not of the companion of ZEUS, but of a figure on another face of the altar, which is now generally accepted as a figure of VULCAN. It is evidently no mere oversight, for WINCKELMANN repeats the same interpretation in his "Monumenti Antichi Inediti." VISCONTI depends on the manifest relationship between each pair of figures as a safe proof of the two first figures being ZEUS and HERA:—"Non dubitiamo dunque che la compagna di GIOVE non sia la sua consorte e germana GIUNONE."

The trident carried by the next figure is sufficient indication of NEPTUNE or POSEIDON. If that instrument of authority were omitted, possibly there would be many speculations about the deity. The companion figure is CERES or DEMETER, "the gold-haired mother of life-strengthening seed." Her connection with NEPTUNE was not satisfactory unless the myth of ARION possessed a meaning for the ancients, which differed from what is derived from a literal reading of the words.

The first figure on the second side of the altar is the plated MARS, and, as pointed out by VISCONTI, it does not differ much from the god as depicted on a puteal in the Capitol of Rome. That the next figure is VENUS is not to be questioned, for the dove is employed as a symbol. WINCKELMANN was not, however, certain about the dove being a sure sign of the goddess, at least, in early art, and he imagined that one of the lower figures holding a flower might be VENUS. The caduceus and talia are sufficient signs to denote MERCURY to a modern student of mythology. But it is well to remember that the Etruscans as well as primitive Greeks were disposed to endow other gods and goddesses with small wings. In later examples of Classic art MERCURY is seen as a beardless youth. But the Pelasgians represented the god with a beard, and, according to PAUSANIAS, in the middle of the market-place at Phææ in Achaia was a bearded MERCURY. WINCKELMANN lays much emphasis on the form of the beard. It was, he says, of the kind known as a pantaloons' beard.

In the oldest Greek examples it also appears, and the epithet, if applied to it, does not signify a twisted beard, "barba intorta," but a wedge-shaped beard. The last figure of the row is assumed to be VESTA. In the arrange-

## II.

ment of the sides the figure of VESTA came next to ZEUS (on another face); and in that way the relationship of the two deities was suggested, for they were children of KRONOS and RHEA.

## III.

It would be excusable for anyone to suppose that the alternation of man and woman, or, as VISCONTI says, "d'una femminile e d'una virile," was disregarded by the sculptor of the third side, for the upper row seemingly

consists of goddesses. That, however, is not the case. The first figure that looks like DIANA revealing herself is APOLLO (the son of LETO, the goddess of darkness), but who was associated with light, and in this case appears to symbolise the removal of the last cloud which concealed his glory. As "MUSAGETES," or leader of the Muses, APOLLO was made to assume feminine robes by artists. There are some examples in the Townley Collection of the British Museum, which reveal the practice. One is seen in the *Apotheosis of Homer*. The bow carried by the goddess is enough to signify the arrow-loving queen, the virgin-huntress, the bow-bearing goddess DIANA, who was an especial favourite with Elizabethan writers; and if APOLLO stood for the sun and day, she represented the moon and night. But ARTEMIS seems to have been a far more powerful deity than LUNA. The third figure was the one accepted by WINCKELMANN as the martial JUNO, on account of the tenaglia, or pincers held by the figure. VISCONTI, relying mainly on the symbol, maintains the figure is VULCAN or HEPHÆSTOS. There were many legends about the deformity of the god, who had been cast from high Olympus. But we may well imagine that people like the Etruscans, who were great metal-workers, would be sometimes disposed to confer on him the fine figure and eternal youthfulness of other gods. He forms a worthy companion for PALLAS ATHENÉ or MINERVA, who was the goddess of the arts, the "Mechanitis" of Olympia.

The lower series of figures being on a larger scale may be suggestive of a nearer relationship to earth. On the first face are the Graces. There seems to have been no certainty about their number, although generally they were supposed to be three, viz. AGLAIA, EUPHROSYNÉ and THALIA. They are not entirely out of place on a slab with ZEUS, for according to one myth he was their parent. A modern sculptor like CANOVA or THORWALDSEN would consider it indispensable for the Graces to be nude, but the early artists took a different view of what was orderly.

The figures holding sceptres on the second slab were considered by VISCONTI as the Ilitia or representatives of the LUCINA of the Greeks, or as some thought of HERA or JUNO. HOMER, he says, describes them in the plural. In the eleventh book of the *Iliad* we hear of "the divine ILITHYÆ that rule the painful frame of human childbirth, the daughters of SATURNIA." VISCONTI goes further, for he suggests that the Ilitia were the Parcæ, although in more modern times it is customary to consider the latter as deciding the termination of human lives rather than the beginning. He finds some support for that conclusion in phrases by PINDAR and PAUSANIAS.

The lower range of figures on the third face of the altar are the Horæ or Seasons, who also could claim to be the daughters of ZEUS. We are so accustomed to four seasons, it may seem absurd to us that any ancient people could suppose there were only three. The Athenians were at one time satisfied with the belief in two seasons. Although there is a figure sometimes introduced in representations which may serve for Winter, that season had no official recognition. As in the upper row of the same slab gods appear like goddesses, it is not unlikely that only two Horæ are represented, and the third figure is that of VERTUMNUS, the spouse of POMONA, who was considered an influential power by ancient husbandmen.

While ancient art receives admiration, it will be necessary to consider the mythology to which it owed most of its inspiration. The myths may have been a popular means of expressing physical phenomena, and the whole cycle of legends relating to the Olympians is probably no more than a poetic effort to express the changes in the world by means of beings who corresponded in a great measure with humanity. But whatever may have been the inner meanings which were known to the initiated, the whole world of mythology vanished from the beginning of the era we are now celebrating. Then, as the great English poet writes:—

The lonely mountains o'er,  
And the resounding shore,  
A voice of weeping heard and loud lament;  
From haunted spring and dale,  
Edg'd with poplar pale,  
The parting genius is with sighing sent;  
With flower-enwoven tresses torn  
The nymphs in twilight shade of tangled thickets mourn.

## ITALIAN ARCHITECTURAL GARDENS.\*

THERE is no error in supposing that the love of the Italian garden in England is to a great extent owing to the influence of SHAKESPEARE. We know so little about the origin of the plays, it would be impossible to adduce any document which would be considered evidence in a legal sense testifying to the residence of the mysterious author in Italy. But the number of scenes which are supposed to be transacted in Italian gardens is remarkable, especially if compared with the practice of other Elizabethan dramatists. In "Romeo and Juliet" the essential part of the tragedy is enacted in the garden of the CAPULETS, and the failure of effect, which is not uncommon on the English stage, is owing to the circumstance that the imagination of the spectators is not satisfied with the confined area presented before their eyes. They wish for that largeness which if not always found in the gardens of Italy is cunningly suggested by artificial means. They seek also the glorious Italian sky which the scene-painter and the limelight man cannot combine to produce, and then there is the perfume which unfortunately is absent from all other gardens but those of Italy. The delightful scene in "The Merchant of Venice" when LORENZO and JESSICA recall old tales of love about TROILUS and CRESSIDA, DIDO and ÆNEAS, and so on, needs an Italian garden for its realisation. Elsewhere all those classic associations would be out of place. As SHENSTONE well remarks, "What an advantage must some Italian seats derive from the circumstance of being situate on ground mentioned in the Classics." But whether alluded to by any ancient author or not, all Italy is accepted by the inhabitants as classic ground, and for the purposes of poetry it is so.

In Italy it must be felt that nature is favourable to the creation of the kind of garden which is preferred by the people. In England, on the contrary, there are limitations which cannot be overcome. Flowers do not attain the size, colour and fragrance which are possible in Italy. The directions, for instance, which were given by BACON are suggestive of the restrictions which the climate imposes on English gardens. Fountains he considered desirable, but pools were, he said, unwholesome, and full of flies and frogs. Sculpture, whether in gilt, wood or marble, might be introduced in connection with gardens. But, as he said, "the main matter is so to convey the water as it never stays either in the bowls or in the cistern; that the water be never by rest discoloured, green or red, or the like, or gather any mossiness or putrefaction; besides that, it is to be cleansed every day by the hand." The Italian had no misgivings about slime and putrefaction; he realised his ideas in whatever way he pleased, and he trusted that nature would become subservient to him. His garden was no mere exercise in agriculture; it was rather a creation. LANDOR shrewdly remarks:—"We English talk of planting a garden; the modern Italians and the ancient Romans talk of building one," and he quotes a letter of CICERO, "Cui CNEUS noster locum ubi hortos edificaret daret."

No better word could be introduced than building, for if we study the plan of any of the great Italian gardens we can realise that the building, including, of course, combinations of architecture and sculpture, was first determined, and the trees, plants and flowers were arranged in such a way as to enhance the parts in stone and marble. Italy was more fortunate than other countries in having resources which enabled the creations to be completed. There was so general an aptitude among the population for the production of art that sculpture was obtainable at a cost which was not ruinous. So little work of the kind has been executed in England we have only one standard, and if a figure which stands in the open air has not the detail and finish required in a figure that is to sustain criticism in a gallery, little value is set upon it. But the Italians had garden sculpture as well as gallery sculpture; they had even statuettes only seen by intimate friends, and they were not afraid their taste would be disputed if sometimes in their gardens figures appeared which retained some of the characteristics of the unwrought material composing them. Such works served their immediate purpose; they

gave satisfaction to the owners, and the criticisms of foreigners at a future age were not taken into account.

The Americans, who appear to look on themselves as the heirs to all the ages, have not neglected to turn their attention to Italian gardens. The most comprehensive work in existence on the subject has just been produced in New York. It consists of about two hundred plates of large folio size, the majority being reproductions of photographs, the plans and views of former states being derived from old engravings. In them we have the most renowned of the architectural gardens of Italy. The series begins with the garden of the Villa Lante, Bagnaja, a fifteenth-century creation afterwards remodelled by VIGNOLA. In area it may be smaller than some of the others, but the fountains, terraces, as well as the residences occupy eighteen plates. The Villa Farnese, Caprarola, has a more famous garden. The caryatides are of immense size, the fountains are varied and quaint, and altogether the efforts of owners and architects were directed towards the attainment of originality. The Vatican gardens, although nearly entirely surrounded by great buildings, present a variety as well as a seclusiveness unequalled by any palace gardens of Europe. The French, who for a long time entered into rivalry with the Italians, have shown their respect for art by allowing the gardens of the Villa Médicis, in Rome, to remain unaltered. Both architecture and sculpture may show the effects of time, but it is felt that students of art will be able to realise the former aspect of the place, and although ground is required to increase the accommodation, the old arrangements are respected. The garden of the Villa Borghese is supposed to have been modified under the direction of MOORE, the Scottish painter, but it is known to all visitors to Rome as one of the most beautiful gardens in existence. It is now national property, but that will make no difference, for it has been practically a public garden. All lovers of art must earnestly wish that no craving for novelty or desire of change will be allowed to alter in the least degree grounds which are remarkable for many reasons. Another beautiful Roman garden is that of the Villa Bel Respiro, or Pamphilydoria. The principal building is in elegant style, with no more than a due proportion of sculpture. It stands on a higher level than the garden, and is approached by terraces that are among the best examples of that work. In the arrangements fine taste is everywhere visible.

The Villa Gerusti at Verona would form an excellent study for a painter of trees. In this case architecture was subservient. The Villa Borromeo, Isola Bella, was evidently laid out to afford as many coigns of vantage as possible for the enjoyment of the beautiful scenery. The elevation of many of the figures proclaimed that however high one ascended a reward was obtainable. The Boboli gardens in Florence are among the best known in Italy. The Pitti Palace has some of the sternness requisite in a Florentine mansion, but in the gardens there was no restraint, and beautiful sculpture as well as picturesque grounds rewarded the gaze of the visitor. The alley of oak trees is an example of Italian treatment without excessive coercion. The gardens of the Villa Castello are remarkable for the carving of rocks into animal forms. The Villa Petraja, the Villa Majano, the Villa Palmieri possess glorious gardens although of diminished area.

In the third volume we begin with the Villa Albani at Rome; the ancient palace now serves as a museum. The gardens were adorned with many structures, which were kept low. The gardens at the Villa d'Este, Tivoli, are evidence of genius in taking advantage of the picturesqueness of the site. Not only the style of architecture, but the trees have been carefully selected. Fine sculpture is observable, but there is much for which allowance must be claimed on account of their quaintness, such as fountains in the shapes of boats, of stone and vast masses of rock which suggest transformation into men. We have too some of the charming gardens of Frascati belonging to the villas Aldobrandini, Falconieri, Mondragone, Piccolomini and Conti. Views are also given of the Royal garden at Caserta, which is unique in the skill shown of the controlling of waters. Finally is shown the garden of the Capuchin convent of Amalfi, a subject which is often represented on canvas by foreign as well as Italian painters.

\* *Architectural Gardens of Italy: a Series of Photogravure Plates from Photographs made for and selected by A. Holland Forbes.* (New York: Forbes & Co., Ltd.)

The illustrations, as we have said, consist mainly of photographic plates. Evidently it was desired to impart to them some of the qualities of drawings, and the sharpness of detail has been subdued. But everyone glancing over the views can realise scenes in which art has combined with nature to create the beautiful. The work has appeared under restricted conditions. Only 750 copies will be printed, and the plates will then be destroyed. The price at first was 37.50 dols., or 7*l.* 15*s.*, but since November 1 the cost has been advanced to 50 dols. = 10*l.* 6*s.* As only a very limited number of the copies are available for this country, and believing that the matter would be one of interest to architects here, the B. and S. Folding Gate Company have made arrangements to secure from the publishers as many copies as can be spared for this country, and will be glad to supply them to architects at the original subscription price of 7*l.* 15*s.*, believing they will be interested in the work. The company are not acting in any sense as booksellers or book agents, but solely for the purpose of being of service to their customers in the architectural profession. This is a liberal offer which we hope will be promptly utilised, for the work will be found inspiring by all who enjoy Italian architecture.

### THE NATIONAL TRUST.

THE report of the Trust for Places of Historic Interest has been issued for the year 1901-02. During the year it has made by far its most important acquisition of property, the purchase of the Brandlehaw Estate, on Derwentwater, for 7,000*l.*, being on a larger scale than anything previously attempted. They also took part in the movement in connection with the enclosure of Stonehenge, the preservation of the view from Richmond Hill, and the preservation of Croxden Abbey, Launceston Castle, and the Bartlemas Hospital at Oxford, of which the domestic buildings belong to Oriel College, who have promised that they shall remain intact for the present. The balance on deposit and in hand amounts to 7,104*l.* The Council have issued an appeal for 400*l.* to secure nine acres on the summit of Kymin Hill, Monmouth. It contains the "Naval Temple" erected in 1800 in honour of the British Navy. When Lord Nelson visited this in 1802 he said that "it was not only one of the most beautiful places he had ever seen, but that, to the boast of Monmouth, the temple was the only one of the kind erected to the English Navy in the whole range of the kingdom." This monument is falling to decay, and it is hoped that the action of the Trust will secure its preservation. Canon Rawsley has written a leaflet dealing with the hill and the historic associations of the neighbourhood.

### THE NEW CENTRAL CRIMINAL COURT.

THE foundation-stone of the new Central Criminal Court, Old Bailey, was laid on Saturday afternoon by the Lord Mayor (Alderman Sir Marcus Samuel). In submitting to the City Lands Committee and their professional assessors his design for the proposed buildings, which we have already published, Mr. E. W. Mountford, the architect, states that the whole of the required accommodation has been provided. In the design generally impressiveness and dignity have been considered of primary importance and ornament has been sparingly used. By a system of mezzanine floors considerable height is allowed for the larger rooms and offices without the waste of space incurred by giving the same height to the smaller rooms. The various rooms and floors are thus also brought into closer connection with each other. On the principal (or first) floor the four Courts open upon a spacious central hall, to be approached by a grand staircase and surmounted by a dome. An important feature is the private corridor connecting the Court with the various retiring rooms for judges and juries, and the apartments of the Lord Mayor, Sheriffs, Recorder and Common Serjeant. A staircase leads from the corridor to the grand jury room below, giving convenient private access for the grand jury to the Courts and for the Recorder to the grand jury room. The police cells are in direct communication with the dock in each Court, and are also wholly shut off from those portions of the building to which the public have access. The Lord Mayor's suite of rooms is upon the principal floor, grouped together at the head of a spacious private staircase leading from the Lord Mayor's entrance, which is screened from the public streets by high gates. The offices for the clerk of the Court are upon the same floor. Upon the mezzanine floor beneath are the two rooms for the clerk of peace, and immediately beneath these, again, upon the ground floor, are the indictment office

and the rooms of the Public Prosecutor. All are closely united by their private staircase, communicating with a separate entrance from the Old Bailey and the record rooms in the basement. The public secondary staircase also affords ready access to any of these rooms. The principal entrance to the ground-floor is from the Old Bailey, and is 14 feet in width. The grand jury room is at the east end of the Newgate Street corridor, in the quietest part of the building. It is entered through the bailiff's room, and has a private stair leading to the Judges' corridor and Courts above. A private entrance for counsel, with staircase and passenger lift communicating with counsel's rooms upon second floor, is provided at the north-west corner. The Lord Mayor's entrance is upon the lower ground-floor. A broad and well-lighted staircase leads to the Lord Mayor's rooms above, and there is room for a passenger lift if thought desirable. Halfway up the staircase is a spacious landing, with fireplace, which might be used as a reception-hall or waiting-room. Two rooms for the police, with a room for the deposit of stolen property, are provided on the Old Bailey front; they have a separate entrance from the street, and communicate by the public secondary staircase with the upper floors. Upon the top floor is the robing room for counsel; it is approached by a staircase and passenger lift from the private entrance on the ground-floor. The various mess rooms adjoin one another and the serving room. The two kitchens adjoin and are practically one. The positions and arrangement of the various rooms have been carefully considered, and the lighting of the whole building has received much attention. The offices and rooms generally are arranged in groups in the most convenient manner. The judges' corridor and the Lord Mayor's suite of rooms are quite cut off from the public, and the prisoners from the time they enter the yard are completely isolated. In regard to the general construction of the building, the architect states that the walls will be built of brick, faced externally with Portland stone. The floors throughout will be fireproof, and the various staircases will be of stone. "The design generally is thoroughly English, as such an important building certainly should be, founded upon the work of Sir Christopher Wren and his pupils." The two large Courts are 35 feet high to the top of the main cornice, above which the dome rises an additional 5 feet. The two smaller Courts are 19 feet high to the cornice and 25 feet to the crown of the arched ceilings. The estimated cost of the buildings is given at 225,173*l.*, of which 179,049*l.* is for the main building and 16,124*l.* for the dome above the main building.

### CRETAN EXPLORATION.

A STATEMENT has just been issued of the work achieved by the Cretan Exploration Fund since the emancipation of the island in 1899 from Turkish control. The fund, of which the High Commissioner, Prince George of Greece, is the patron, has for the last three years been continuing the work begun long ago by Pashley and Spratt, and carried on since 1894 by Mr. Arthur Evans. The first appeal brought 500*l.*, and no time was lost. Early in 1900 Mr. Evans, having secured rights on the hill of Kephala, started operations at Knossos, and Mr. Hogarth, as the director of the British School of Archaeology, secured another site. Accounts have from time to time appeared in the *Times* of the magnificent palace disclosed by the labours of Mr. Evans. In the lower town of Knossos the excavations of Mr. Hogarth revealed a number of dwelling-houses of an even greater antiquity than the palace; and he conducted, in the joint service of the fund and the British School, a successful exploration of the Dictæan Cave, the legendary "Birthplace of Zeus." In the first instance a large proportion of the expense at Kephala fell on the explorer himself. French and Italian scholars can rely to some extent on the public purse where we have to appeal to public spirit. But this was not wanting, and a further sum of 2,500*l.* was subscribed. Thus in 1901 a substantial sum was available for Mr. Evans to supplement his own large outlay. Grants were also made to Mr. Hogarth and to Mr. Bosanquet, the new director of the British School at Athens, and work was simultaneously carried on at Knossos, Zakro, and Praesos, with brilliant results. At the last named an important discovery was made—an inscription cut in Greek letters of 400-300 B.C., but composed in a non-Hellenic language. A third appeal was issued in the autumn of last year; but, unfortunately, apart from the donations of the British Association, the Royal Institute of British Architects, and the Hellenic Society, the response was inadequate to the task. It thus became necessary in the present year to devote the whole income of the fund to Knossos. Even so, Mr. Evans has had to make up a deficiency of about 1,000*l.* on this year's work alone. The British School at Athens, however, has been able to devote a small sum to Crete, and Mr. Bosanquet has been successfully exploring the site of Palaeokastro, courteously resigned to the school by the German Archaeological Institute. The pro-

gramme for 1903 consists of two parts. It is proposed that of any fresh subscriptions which may be received, 200*l.* shall be set apart to continue the excavation of Palaeokastro and the search for the Temple of Dictæan Zeus, and that the remainder shall be applied to the work still to be done at Knossos, and, if possible, to the reduction of the burden which has fallen on Mr. Evans. The committee appeal earnestly for funds to enable them to carry out a forward policy in excavations which have already proved so fruitful. The magnitude of the labours at Knossos can be gauged by the fact that as many as 250 workmen were employed for most of the time between February 12 and the end of June 1901. The excavation at the south-east corner of the palace has still to be completed, and other works of delimitation must be carried out in other directions. Further research, too, is needed into the lower strata of the palace and the Neolithic deposit. In the plain of Palaeokastro—about three miles by two—there has been discovered the site of a Mycenaean town, extending over an area of 500 by 300 yards, and of cemeteries which throw new light on primitive burial customs. The largest of the houses which was examined lies inland in a group of what seemed to have been upper-class houses, constructed partly in the “Megalithic” style, like the Mycenaean homesteads in Crete, partly of regular ashlar masonry. This house anticipates in some respects the plan of Greek houses of classical times. An interesting account is also given of the results obtained in the cemeteries.

A fuller exposition of the work of the fund will appear in the forthcoming annual of the British School at Athens. The subscriptions for the year ended October 31 last amount to 1,817*l.*, and the hon. treasurers are Sir W. B. Richmond and Mr. George Macmillan. Mr. J. L. Myres is the hon. secretary. It should be added that the Royal Academy has assigned a room during the winter exhibition for the display of casts, photographs and drawings of the work accomplished.

#### SOCIETY OF ARTS.

THE Council of the Society of Arts, acting on the recommendation of the judges appointed by them—Sir William Preece, Mr. Robert Kaye Gray and Mr. Alexander Siemens—have awarded the prize of 50*l.*, together with a silver medal, offered for an essay on “Existing Laws, By-Laws and Regulations Relating to Protection from Fire, with Criticisms and Suggestions,” to Mr. T. Brice Phillips, sanitary inspector to the Uckfield Rural District Council, of 4 Aylesford Terrace, Uckfield, for the essay bearing the motto “Fiat Lux.” The Council have also awarded a prize of 10*l.*, with a bronze medal, to Mr. George H. Paul, for his essay bearing the motto “Ariston Metron”; and a similar prize to Mr. W. Craig Henderson, for his essay bearing the motto “Sola Virtus Nobilitat,” these two essays being considered to be equal in merit. They also consider the essay sent in by Captain Arthur W. C. Shean, bearing the motto “Fuego,” to be worthy of honourable mention. The judges reported that the essays were, on the whole, of a meritorious character, and, generally, of a high class. It is proposed that the prize essay should be read as a paper at one of the ordinary meetings of the Society of Arts. In all 12 essays were received in response to the offer.

#### CRYSTAL PALACE SCHOOL OF PRACTICAL ENGINEERING.

ON the 18th inst., Mr. W. H. Maw, president of the Institution of Mechanical Engineers, presided at the distribution of certificates to the students of this school. The reports of the examiners on the work done by the students during the past term were of a very satisfactory character. Mr. Francis G. Bloyd, who 22 years ago passed through the school himself, and who examined the students in the mechanical section, reported that the whole of their work had been carried out in a satisfactory manner. In the lecture examination several papers of marked ability were sent in, while in the drawing office, pattern shop, and fitting shop good work had been turned out, giving evidence of careful and practical instruction. Commenting upon his examination of the work performed by the civil engineering students, Mr. W. H. Holturn, the examiner for that section, said he noted the results of a carefully progressive course of training, carrying with it both the theory and practice in a manner within the grasp of the students. Mr. Arthur H. Allen, who examined the work done by the students in the electrical section of the school, reported that the results were highly satisfactory considering the short time the students had been under instruction. The progress made and the wide range of subjects covered were surprising and bore witness both to the industry of the students and to the excellence of the system of training. The Chairman gave an address to the students and afterwards distributed the certificates. Mr. J. W.

Wilson, the principal of the school, gave an interesting retrospect of its history, during the 30 years of its existence. Votes of thanks were accorded to the examiners and to the chairman, the latter of whom, in reply, said he could not speak too highly of the value of the work done at the school.

#### TESSERÆ.

##### Pierre Puget, the Sculptor.

AS to the date of Puget's birth, it is not quite positively known, but Bougerel, who was acquainted with Puget's grandson, says that he was born on the last day of October, 1622. The future sculptor appears to have been born in a place where he could pick up good potter's clay, with which it may be assumed that he played in his childhood, for any child in the least endowed with a faculty for modelling would amuse himself in that way if the material were ready to his hand. There is a tradition that Puget was one day found on his back watching an eagle in the air, and that he afterwards rudely modelled it, all which is not improbable. It appears that Puget's father, who is said to have been sculptor and architect, was simply a stonemason, and that his intention was to bring up his two eldest sons to his own handicraft. Pierre, who was the third son, became a boat-builder, and it is curious to trace how the things which surrounded him in infancy led to his subsequent career. It does not seem at first sight that a stonemason's son, in a seaside valley near Marseilles, is in the most promising condition for future development into a great sculptor; but it is probable that if there had been no clay at hand Puget would not have amused himself in modelling, and if he had been born in an inland valley he would not have become a shipbuilder. The connection between the shipbuilding (or rather the construction of galleys, for that was Puget's specialty as a young workman), the clay modelling, and his future career may soon be indicated. Now and then he was entrusted with the rude carving of a figurehead or an ornamented stern, and soon his master recognised Puget's superiority in this department, for where little science is called for, a strong natural gift makes its way without those long delays which are caused by the requirements of an elaborate training. Puget, however, was not satisfied with being a chief amongst rough workmen; he saw in the port of Marseilles the richly carved Italian galleys, and wanted to go to Italy, whither he betook himself at the early age of eighteen without finishing his apprenticeship. He went to Leghorn by sea, and thence straight to Florence, where he hoped to be able to earn his living. He took a lodging in an inn, where he left his clothes and his tools to get a little credit for his keep, as he had spent all his money in the passage from Marseilles. There was, however, a terrible and unforeseen difficulty—the masters at Florence would not employ him because he was a foreigner. At length, being reduced to the verge of despair, for he could not redeem his tools, he espied an old carver in a little shop making ornaments in wood, but he had no work for Puget. However, if he had no work to give, he had a heart to be touched, and left his work to take young Puget to the Grand Duke's carver, who allowed himself to be influenced by the old man's eloquence and sent Puget to his foreman. This foreman received the stranger contemptuously, and by way of derision set him to do a small panel. This he accomplished to the satisfaction of the master, and seeing workmen inferior to himself employed upon carved pedestals, he asked permission to execute one of his own invention. The result was so satisfactory that his master took Puget into his favour and lodged him in his own house, where, contrary to the usages of his country and class, he made him sit at the same table with the members of his own family. Puget's master did yet more for him by giving him a warm recommendation to a friend in the same trade in Rome, where he soon afterwards established himself.

##### Narni Cathedral.

The Duomo is a very curious building. The nave is basilican, separated from its aisles by arcading of nine arches, from monolithic columns with debased Attic bases and Corinthian capitals. The arches are segmental, but so flat as to be scarcely more than an entablature. Above the arcades is a clerestory of small round-headed lights, entirely blocked, and only visible from the exterior. This nave is vaulted in four bays of Roman vaulting, rising from horizontal strings. The aisles are similarly roofed with bays of intersecting cylindrical vaults. Eastward of the nave and aisles is a lantern-space covered with Roman vaulting in three bays, from north to south, and with modern extended transepts. The choir is of later Romanesque, an extremely broad five-sided apse raised over a crypt—as broad as the nave and aisles together. The altar, under a baldachin, faces east, and there are good stalls with pointed canopies. The apse is roofed with cellular vaulting, the ribs being plainly chamfered, and the vaulting-shafts being brought down to the ground, interpen-

trating through a projecting string-course, which is supported all round the inside walls on a series of corbel-brackets. The apse windows are all blocked. The crypt is quite modernised. There is an ambon against each pier of the nave arch. This arch, which is much loftier than the eastern arches of the aisles, is round-headed, its piers being banded with flowered capitals. An old vaulted chapel remains on the north side. Externally the north door has panelled jambs and half-figures of lions at the base, its doorway is square-headed under a segmental-headed tympanum. The tower is very fine, square and peculiarly massy; the belfry stage has three equal lights on a string and with connected hoods, a lower stage has two similar (but plainer) lights on each side.

### Pictures and Teaching.

The intellectual and moral conditions which affected the artist and public of the fourteenth century do not affect the artist and public now; if they exist at all it is in a profoundly modified form. In an age when books were rare, and when ignorance perhaps was even greater than at present, it might have been demanded of the artist, with some fair show of justice, that he should dedicate his chief powers to the promotion and diffusion of religious and useful knowledge; but now, when a cheap literature is accessible to all men, to make such a demand would be the exercise of an unnecessary and unreasonable tyranny. In the kingdom of art imagination is not the handmaid but the mistress of the understanding; and work which is not done for its own sake, in which the chief place is claimed for the historical or the moral, in which the attention is seized by the subject rather than by the rendering of the subject, in which the contents form the weightiest part, loses its æsthetic character, and cannot possess those poetic elements which fire the fancy and rouse the emotions. It is not inspired, it is not suggestive. "Suppose," says Springer, "that Raphael intended to depict in his *Disputa* and *Scuola d'Atene* systems of philosophy. Then before these, as before other didactic works, the fancy will remain unstimulated and the spectator will come before the picture with the question, What and whom do these groups, these single figures, represent?" In a truly artistically conceived composition the historical can form but the background; it must be developed and completed by the expression of the universal human element, freed from all accidents of time and place. Such work cannot be better described than in the words used by Burckhardt, in speaking of the *Incendio del Borgo*, from which the third stanza of the "Vatican" takes its name:—"Here we have purely artistic ideas carried into reality, free from historical or symbolical considerations in the dress of a heroic world. The artist must have been inspired by the present enjoyment of lively invention." The intelligent spectator must ask, before a truly poetic creation, not for the facts as they happened, or as he may imagine them to have happened, but for the train of thought, of fancy and feeling which they excited in the mind of an inspired man. The story is to the artist as the legend to the poet, between the lines of which he reads, letting the dead past suck out the life of his own soul, until it stands before him a new creation, and this process is not conscious. The great defect of the Quattrocentisti, regarded as artists, the great defect of all men who aim at "teaching," is that the view taken by them of their work is eminently subjective; instead of reflecting their subject, like a faithful mirror, they endeavour to force it into some preconceived shape then dominating their own mind. Work done in this temper can never claim the name of ideal, for it is always marred by individual bias or local colouring.

### Painters and Sculptors of Greece.

The statuary of Greece had no other advantage over its painters than that they used more durable materials; blessed with equal genius, formed by the same education, their arts went hand in hand to perfection. If Praxiteles be celebrated by Diodorus Siculus for having transfused into marble all the passions of the soul, the same power is attributed by Pliny to the pencil of Aristides. It is not probable that men of taste and letters, whilst they were eye-witnesses of the divine character in the Apollo, of the beauty and tenderness of the Venus, and the wonderful expression of the "Laocoon," should celebrate those very qualities in the works of their painters, were they not eminently possessed of them. Pliny in his description of that famous picture of the "Sacrifice of Iphigenia," by Timanthes, observes "that the painter having exhausted every image of grief in the bystanders and above all in the uncle, threw a veil over the face of the father, whose sorrow he was unable to express." If the ingenious Timanthes has left us to conceive an idea which he could not execute, Aristides, on the other hand, has executed that which is almost above conception; by him was painted "a town taken by storm, in which was seen an infant creeping to the breast of its mother, who, though expiring from her wounds, yet expresses an apprehension and fear lest the course of her milk

being stopped, the child should suck her blood." What a perfect knowledge of the human soul must this painter have had to enter thus feelingly into her inmost workings. What a power, next to creative, to make such tender movements sensible in the midst of tortures, and the mother's fondness distinguishable through the agonies of death? Let terror be united with pity, the muse of painting has completed her drama. Of this, the "Ajax" and "Medea" of Timomachus are beautiful examples.

### The Waits.

The wayghte, or wayte, was originally a minstrel watchman, and the kings of England, as well as the mayors of large corporate cities and towns, seem to have employed them in preference to common watchmen. By a document in Rymer's "Foedera," vol. ix, "De Minstriellis propter Solatium Regis providendis," it appears that in the reign of Edward IV. "a wayte that nightelye from Mychelmas to Shreve Thorsday pipethe the watche within this courte fower tymes, in the somere nyghtes three times, and makethe bon gayte at every chambere doare and office, as well as for feare of pyckeres and pillers; he eateth in the halle with the mynstrielles;" it then goes on to state his allowance of bread, ale, coals and so forth, for each night. By the same document it appears that there was a "yeoman-wayghte at the makinge of knyghtes of the Bathe," who, "for his attendance upon them by nyghte tyme, in watchinge in the chappelle, hathe to his fee all the watchinge clothing that the knight shall wear upon him." The waits seem to have been always distinct from the common watch, which was called the marching watch, and never, we believe, the waits. At a later period the term waits seems to have been restricted to the band of minstrels kept by the City of London and other large cities and towns. We read of the City waits frequently, from their attendance on the City pageants, and of the waits of Southwark and other places. In *The Tattler*, No. 222, a writer from Nottingham complains that the young men of fashion there "make love with the town music," and that "the waits often help him through his courtship." The waits, or stipendiary town-musicians, have for many years, we believe, ceased to exist in every corporate city and town in England.

### Westminster Abbey and St. Margaret's.

Very few people who see Westminster Abbey realise till they get inside that it is the loftiest church in England. Placed where it is in London and in such a part of London it cannot possibly soar over all surrounding buildings in the way in which much smaller churches soar over all surrounding buildings in other places. Even if it had towers in proportion to its size St. Peter of Westminster could never soar over Westminster in the way that St. Peter of York soars over York. At York it is not merely the towers, it is the bulk of the minster itself which rises above the city. The ridge of Westminster is 40 feet or more higher than that of York, but Westminster can never while it stands be the same predominant object which York is. It has still less chance of overtopping all its neighbours since a neighbouring building has sprung up by which it is itself overtopped. St. Peter's is higher than other English minsters, but it is not higher than they are in the proportion in which other buildings at Westminster are higher than the same kind of buildings in other English cities. Its positive size is therefore likely to be forgotten. But we are recalled to its positive size when we see that a parish church of the larger sort, with a tower which would alone be a prominent object in most towns, seems small by the side of it. Our ancient minsters were none of them built to stand alone. A great church, whether secular or monastic, was only part of a whole. It always had other buildings adjoining or standing near to it, grouping with it and thereby increasing its effect. Gateways, refectories, bishops' palaces, prebendal houses, wherever they retain their ancient character group with the church and improve its effect. Among these subordinate buildings a subordinate church is often found, and it always helps to set off its mightier neighbour to greater advantage. St. Margaret's is more important and needful for this purpose than the subordinate church anywhere else. It is an essential part of the group, which it would be the ruin of the whole effect of the abbey to take away.

The Repair of the roof of Sherborne Abbey, the condition of which was causing some anxiety, is to be taken in hand at once. At a meeting of the inhabitants of the town a report was presented by Mr. Bachelor, who has had experience at Chichester Cathedral and who volunteered his services. This showed that the principal defect is in the leadwork of the nave. It was decided to raise a fund for carrying out the necessary work, and Mr. J. K. Wingfield-Digby, M.P., promised 200*l.* on condition that the balance was forthcoming without recourse to bazaars and "jumble" sales. A considerable sum has already been raised.

## NOTES AND COMMENTS.

IT must be admitted that it is not always agreeable to be living in a house adjoining others which are in progress. But it is an everyday experience that tenants are willing to brave the inconvenience and, in fact, occupy houses while still incomplete. The case differs when building works are undertaken, which must inevitably disturb the rest of established tenants; but the Courts sometimes recognise the wisdom of living and letting live, and do not grant injunctions for the suspension of works when applied for. A few days ago there was a case before Mr. Justice SWINFEN-EADY in which the occupier of a house at Haverstock Hill sought to restrain the Charing Cross, Euston and Hampstead Railway from nightwork. It was said a crane was working day and night continuously, hauling out excavated material and letting down tube sections and other material necessary for the construction of the station, lifts and railway, and that the noise was an intolerable nuisance, a steam crane being worked within a few feet of plaintiff's bedroom. The defendants relied on the authority they possessed under their special Act, and their defence was supported by affidavits of their engineers, who testified that it was necessary with regard both to despatch and safety that the operations should be carried on continuously, and that the work was being accomplished by means of the best modern appliances, and with as little noise as possible. Under the circumstances there was hardly any other course open to the judge than to refuse the injunction. But as further claims are being made by the plaintiff, it was ordered that the motion stand over till trial, and he directed the action to be expedited, and put the parties on terms to deliver pleadings in a limited time, so that, considering the state of the business of the Court, the action would probably be tried very early next sittings. It is not for the public good that obstacles should be raised against the completion of railway works, especially in the Metropolis. But as the annoyance is, in the majority of cases, very serious to the occupants of adjoining houses, there should be a more general recognition of compensation to occupiers.

THERE was some reason in the statement that the modern Christmas in England was a creation of CHARLES DICKENS, and as hypercritics affirm that writer's influence is declining, so the hearty Christmas of the "Carol," the "Chimes," the "Haunted Man" is also on the wane. What DICKENS did was to revive a spirit that was very ancient in this country. Christmas has its archæology, and anyone who doubts that fact has only to read the book by Mr. W. T. DAWSON, called "Christmas: its Origin and Associations, together with its Historical Events and Festive Celebrations during Nineteen Centuries" (London: ELLIOT STOCK). Dr. PRIMROSE found as much pleasure in admiring happy human faces as some of his learned contemporaries did in gazing on the colours of a tulip or on the wings of butterflies. In the pages of Mr. DAWSON's book we have an historical account of the efforts which were made from a very early time to enable men to enjoy at least a brief spell of happiness, partly for the benefit of onlookers. The celebrations exercised influence more or less throughout the year. It is not impossible that the festivities were factors in the planning of English houses. For instance, we learn that when HENRY II. visited Ireland, where Christmas was never of much account, and wished to have festivities in Dublin, there was no building large enough, and it was necessary to improvise one for that special purpose. WILLIAM RUFUS and RICHARD II., with all their faults, kept up the old customs, and Christmas revels may have had much to do with the creation of Westminster Hall. To welcome crowds of neighbours sufficient space was indispensable, and the rough performances which were obligatory could not be gone through in holes and corners. In our time it is difficult to become merry on any stipulated day, but it is interesting to hear of a time when man's pessimistic spirit was more under control, and could be regulated according to the almanac. In the pages of "Christmas and its Associations" we can read of people who had some power to forget their cares, and the information is more acceptable than much else that passes as archæology.

SINCE The Cathedral Series was commenced in *The Architect* a great many descriptions of the buildings have appeared, varying in size and price. The latest is a single volume comprising not only the English but the Welsh and Scottish cathedrals, entitled "The Cathedrals of Great Britain: their History and Architecture," by the Rev. P. H. DITCHFIELD (DENT & Co.). Westminster and Beverley Abbeys are also described. It is a remarkable example of compression; the sentences are all short and each one contains a fact. The information given is as much if not more than the ordinary visitor will care to go through, and if time can be afforded afterwards to study, enough material is forthcoming. Students of architecture will often find a benefit in having the whole series of English cathedrals brought together for the sake of comparison, and this handy illustrated guide can be recommended. The author has received aid from deans and canons in residence. The illustrations, although on a small scale, are often interesting, especially those by Mr. RAILTON. Plans are given of the principal buildings. It is to be regretted that Truro Cathedral is not placed on the same footing as the old buildings. The author says, "The newness of this cathedral and the entire absence of any historical traditions and associations will perhaps hardly tempt travellers to journey so far west to see the creation of modern architects and builders." This is not an encouraging remark for living architects, and we do not approve of the theory that historical traditions and associations are to be the criteria for judging and enjoying a work of architecture. In all such cases it is well to take Dr. JOHNSON'S advice, and to clear the mind of cant. There are very few Mediæval churches which will sustain a rigorous criticism in all their parts. Nor is it only in design that modern buildings will sustain scrutiny. Cheap and unsound construction, or would-be massiveness of weak masonry, were known in the Ages of Faith. We must, therefore, demur to Mr. DITCHFIELD'S concluding observation, "Whether our modern architects can build so surely and so well as our ancient monks and priors time will show; but reports speak none too well of the substantial nature of all that has been done at Truro." If the author will take the trouble to read the last report of the cathedral committee he will find that those gentlemen are not alarmed about the slight imperfection which has appeared in one or two of the base stones, and which was caused by rigidity of construction and the theoretical perfection of the jointing.

So many theories have been evolved for an explanation of the fall of the Campanile, there seems to be a difficulty in finding one which can be considered novel. From inquiries instituted by a German specialist, it would now appear that the use of wood was one of the factors in the catastrophe. Beams of chestnut were, it is said, introduced in the inner part of the tower for the purpose of equalising the pressure as well as to serve as ties. The outer surfaces were in course of time destroyed by worms, whilst the inner decayed through dry-rot. Although some of the ends were covered with lead for protection dry rot made its way. It is asserted that Signor BONI, who has charge of the operations, has adopted this view of the origin of the disturbance.

LAST week we referred to the demands which had been made on M. OSIRIS in respect of the restoration of the Château of Malmaison. The French tribunals can sometimes be severe, especially in cases of unwarranted demands. The contractors employed by M. OSIRIS have been made to suffer. The contractor for masonry has not only had his claim reduced from 400,000 francs to 250,000 francs, or nearly one-half, but he has been ordered to pay seven-eighths of the expenses. The locksmith will have to pay M. OSIRIS 3,000 francs. The painter and the joiner will also have to meet the remainder of the costs.

## THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. H. T. Hare (president) in the chair. The following were elected as members:—Messrs. K. W. Booth, R. T. E. Neeves, W. H. L. Keay, Ernest Newton, H. H. Wigglesworth and Sir John Taylor, K.C.B. Mr. W. H. BIDLAKE read a paper entitled

### The Study and Delineation of Old Buildings.

The intimate association in the title of this paper of the study of old buildings and their delineation might suggest that there was an inseparable connection between them. Such, however, is far from the truth.

The study of old buildings does not necessarily involve their delineation or the delineation of them invariably imply their study. This statement seems self-evident—perhaps too self-evident to attract attention. A student is as a consequence advised to sketch and to measure old work without any qualifying advice as to what to study or how to study.

Growth is not helped by unsuitable food badly digested.

Measuring up bad examples and making drawings of them in a mechanical spirit will neither develop a student's taste nor his knowledge. Perhaps it did not occur to him that either his taste or his knowledge required developing. "Then," you ask him, "why make any measured drawings at all?" "Well, I thought it might be a good thing to get them published in one of the building journals," or, "One must have a set of show drawings to take round the offices to get a berth." More likely still they are made to compete for one of the Institute or Association prizes, or for the A.R.I.B.A. examination, or to play their part in a deeply-laid scheme worthy of an American company promoter. For if a student has made his finished drawings at a school of art he will send them in for a local prize. Having won this, they will appear at the national competition perhaps with a gold or silver medal award. They will then be passed on for the Institute silver medal, and the next year they will once more reappear, supported by sketches for the Pugin. They will by this time have been published in the building papers and the "Architectural Association Sketch Book," and will also have won for their author a seat in the office of some prominent London architect. And, finally, they will serve as testimonies of study for the Institute examination, if, indeed, they do not eventually once more reassert themselves in the garb of a monograph. And all this with the same set of drawings. Well, if measured drawing has not advanced the student's taste, it has at least helped to stimulate his commercial instinct.

But where does the study of old work come in? It would be interesting to learn how our wide-awake student came to select his subject. His principle is, the greatest effect for the least labour. Sound commercial doctrine. It must look costly, but be cheap. This man might verily have made his fortune if he had not elected to be an architect. He selected the portion of the building which he measured up because it was easy to get at and would make a telling set of drawings. Another student would select his subject "because it had not been done before, or because it was one of the subjects recommended by the Institute."

This desire to make the drawings rather than study the building naturally influences the method of work. Arrived at length face to face with the subject of his choice the student sets about drawing and measuring, and having taken all the leading dimensions and made more or less freehand drawings of the mouldings, and taken any further notes necessary to complete certain elevations or sections he has decided to illustrate, he buys, or himself takes photographs of ornamental detail sufficient to enable him to elaborate the drawings at home. Perhaps a month after his return and a hundred miles away from his building, he will commence plotting out his measurements. Some will not work out, and there is no chance of correcting them. He assumed the walls were at right angles and that the whole of the work was set out with the rigid accuracy of his tee-square and set-square. An examination of the photograph is then substituted for the study of the building, and a draughtsman's skill covers a multitude of inaccuracies. The drawings win the prize; that is sufficient. Such measured work is not study; indeed, I would go further and say such measured work prevents study by substituting the counterfeit for the genuine. I lay stress on this distinction or you will say, "Thou didst come here to bless measured drawings, and lo, thou hast cursed them altogether."

What, then, shall we say of the student who has substituted study by photography for measured work and sketching? It would be absurd to deny the value of photography to an architect, or the delights of its pursuit; but to take photographs of a building is not the way to study it. Here is a fine parish church. Suddenly the amateur architectural photographic enthusiast appears. He manoeuvres for a good point of view; sets down his camera; focuses; draws the dark slide; turns his

back to the building; removes the cap, and studies his watch; claps the cap on again; packs up, and rushes for the station. The enthusiast objects that this description is a caricature. Very well. Photograph at leisure and with great care; still, how can you judge the proportion of a façade when you see it standing on its head? "Do you know such or such a church?" asks one. "Oh yes, rather. I took at least a dozen snapshots of it last summer. I haven't developed them yet, but I hope they will come out all right." The amateur photographer objects with increased resentment. "It is absurd to suppose that you can spend some time about a building without forming a very good idea of it." Yes, but he forms his idea of it when he is walking round and thinking about it, just the precise part of his stay when he is not photographing it. Clearly if he is taking a dark interior which requires an hour and a half's exposure, he must be doing something whilst—and I think that one of the ways in which photography is an aid to the student is that it compels him to wander round and about a building, and observe it more in detail than he otherwise would do—whilst the cap is off his lens; that is unless he avails himself of the opportunity to go off to the inn and get lunch. Happily, those students whose ideal it is to obtain as many prizes as possible with one set of drawings or the minimum of study, as well as those who regard photography as an efficient substitute for pen and pencil, are in the minority, but it is as well to recognise wrong methods whilst we are in search of right ones.

Our aim, then, shall be to study the buildings themselves, and only to make drawings of them as a means to that end. If, as supplementary to this study, our drawings have been made with that artistic finish which is peculiar rather to the draughtsman than the student, so that they are awarded a medal or a studentship, so much the better. For no kind of study is assisted by slovenliness of expression, and therefore the careful study of a building should be embodied in the most painstaking description, both with pen and pencil. Herein lies the true connection between the study of old buildings and their delineation. By this study we seek to increase our knowledge and sharpen our æsthetic taste. This is our aim, and our subject will be selected accordingly. It will certainly be a subject with which we feel in sympathy, one which we feel drawn to by excellences of one kind or another which excite our enthusiasm and our desire to emulate them.

Let us cultivate catholicity, remembering that want of sympathy is often due to ignorance, and that whilst sympathy may stimulate study, study in turn may awaken sympathy. If, however, we feel that a building is bad in design, and that we shall learn nothing from it, we will not make measured drawings of it because no one else has, as yet, made them or for any other reason equally foolish. But how shall we study our building or such part of it as we may have selected? By measured drawing and sketching? What are these the only means of study? They are certainly the most frequently recognised means with architectural students and, perhaps, there are some who think them all sufficient.

I believe there are occasions when a pipe will serve us better than a 2-foot rule. A pipe makes one contemplative, and to walk round an old building in a contemplative mood is to have put oneself in train for studying it, for catching the spirit and romance of it. Under its kindly influence the imagination will conjure up from the stores of one's historical and archaeological learning—if it is there to conjure up—the conditions of society and the craft guilds, the observance and the ritual of the Church, and the quaint superstitious customs of the country folk at the time when the stones of the building were put together and which find expression in it in its arrangement and decoration. And falling thus into a sympathetic reverie, the eye wanders over the building, noting this or that point of interest whether of design or construction. Then leading our thoughts back to modern times, and the conditions of to-day, comparing and criticising and drawing conclusions, let us take out our note-book and write down our impressions whilst they are still warm, whilst the glow of feeling unlooses our powers of expression whether by descriptive note or pencil sketch. Very likely the building will live in our memory through all our future life; for we remember most what we feel most. It is particularly important to make a general study of the whole before making a particular study of a part, so that the relationship and proportion of one to the other may be adequately perceived. One may sometimes see a student fasten on some detail which attracted him on his first approach, and devote his time so exclusively to it that he leaves without any idea of its setting or the part it played in the whole building. Do not, therefore, study details without making a key sketch sufficient to show their position and relative value to their surroundings. Do not accept a design because it is old: it may be old and bad. Always keep the critical faculty on the alert. This habit is of the very essence of an architect's study of old buildings. You will not regard Salisbury as a model west front because it was built in the thirteenth century. Standing

in front of it you will question yourself: Is it good? Could it be improved? What are its defects? Perhaps it will remind you of a comparison you have made between the west fronts of Siena and Orvieto cathedrals, and your thoughts will turn from the confusion and irresolution of Salisbury to the commanding lines of Notre Dame. Then take out your notebook and try your hand at it. Take the west front as it is, and with as little alteration as possible pull it into shape. If you have a companion with you on your excursion, let him do the same, and then compare notes and discuss it together.

A companion of the right sort, that is, one who is equally bent on study, is a great gain on a sketching tour. Of course, he can hold the tape, but he can do greater service than that. He can come up and ask you what you think of such a building. This compels you to give an answer. If you reply merely, "Oh, very good," you are depriving yourself of an opinion more than you are depriving him—your own opinion, which you have not taken the trouble to form. If you are wise you will treat his question seriously. You will look at the building well, and in a critical frame of mind. Not only will the process of so doing lead you to notice many points which you would otherwise have passed over, but you will have subjected yourself to the healthy exercise of making up your mind. It will not only reveal the building to you, but you to yourself. Your companion will probably have formed some opinion of his own before asking yours, and he will differ from you in some points. This will lead to a more careful scrutiny of the building in search of evidence in favour either of your view or his, and in the end you will both have gained in knowledge and in the formation of critical taste. I know hardly any advantage in the study of old work greater than the discussion of it with a fellow-student who is thoughtful and well informed. If you are alone, do not on that account fail to come to a conclusion as to whether you like or dislike any building worth attention, and why you like it or dislike it. Keep a note-book for the purpose of writing down a critical description of such buildings. On first commencing such a practice you will be astonished to find how vague your impressions are. I am not here referring to those aggressively dogmatic opinions which characterise the very young student, who always regards the work of contemporary architects as beneath contempt. Such opinions are not the result of thought, nor are they founded on knowledge; they are simply a little preliminary crowing necessary in personal development, and remind one of Dr Jowett's remark to his students, "For we are none of us infallible, not even the youngest." Every student has a right to the belief in his own infallibility until life disillusion him; it is the man who has no opinion of himself and is unable to form one of anything else who is beyond hope.

As time goes on, the judgment, well practised by such method, is likely to become more and more self-reliant, for the mind will have laid up an ever-increasing store of knowledge for comparison and co-relation. Thus the study of this building is amplified by a previous study of a similar one, and the points of difference are noted and the reasons for them investigated. Perhaps it is that the building material is different, or that being rather later in date certain decorative forms show signs of change. In a third building of still later date these signs are amplified, and the student comparing this with that, begins to detect in the various examples which at first seemed isolated and apart a law of common development, a law of life. He now begins to generalise, timidly at first, but as new observations confirm or modify his previous conclusions, ever with greater boldness and wider range of view. He will then be in a position and have a right to theorise, and will from the habits of mind he has acquired, always bring his theories to the test of his facts. Now compare the position of a student who has adopted this method of study—although content with thumbnail sketches and notes, he may never have made a measured drawing—with the one who made one set of drawings and swept all the prizes away within reach. The world, judging by tangible and visible results, proclaims the latter the coming man. So he is at first, the other's day comes later but lasts longer.

How many prizes there are for drawings; how few for critical study. Is it not possible that at some future time, either at the Institute or the Association, more awards will be given for thinking, and especially for thinking and drawing combined? I think the essay prize is one of the most useful that the Institute offers, but the subject set is often one which the student can only illustrate by copying prints from books or photographs, and stimulates his reading rather than his critical faculties. What I think is wanted is a prize for an original and critical study of some particular class of buildings or parts of buildings easily accessible in this country, to be illustrated by sketches and measured drawings made by the student from the buildings themselves.

In the study which we are considering it will be very necessary to supplement work on the spot by also studying it in books, so as to furnish ourselves not only with the conclusions to which others have arrived on any particular subject, but to

acquire that general historical knowledge which, with the help of our own imagination, will enable us to set the design and construction of the buildings within the social and historical environment of the time. How can one study Stokesay Castle or Haddon Hall and understand the arrangements of their plans without knowing something of the social and domestic life of the times? Looking at the buildings will not teach us this, however cleverly we may guess at the purposes of this or that. We must go to Hallam and to Green. Again, we must learn about the conditions of labourer and craftsman, of the prevalence and organisation of guilds, of the position of the designer, the magister, of the force and direction of tradition, of the tools in use at the time and of the methods of working materials and incorporating them in the building.

We must not forget also to study the traditions, the ritual, and the history of the Church so far as they affect ecclesiastical building; this will also involve some knowledge of the distinctive requirements of the various religious orders. In the same way, some knowledge of the methods of attack and defence of the period will help us to understand military architecture. All this means systematic reading, which perhaps the everyday student does not feel disposed to undertake. Well is it for him that the Institute examination compels him to acquire some knowledge on these points in spite of himself. Vitruvius considered in his day that an architect should be a man of many accomplishments, and now as then an architect's culture will find expression in his buildings. In addition to this more general study, we must further investigate the circumstances of the particular building we are examining. To do this we must find out what we can of its history, and the part it has played and was intended to play in the past. We must especially inquire into the properties of the local materials of which it is built, and of any traditions of working them which still survive.

Old buildings are apt to seem impersonal to us. The colours with which nature has decorated them, as if to deceive us that they are her work and not man's, give them the air of being the product of the land around them, like rock and tree, and the human life that has thronged them since that far-away time when they were built confuses the vague glimpses of their founders like a veil drawn before a face. But we must not forget that they were designed by men so similar to ourselves that if one of them were to return to earth he would probably drop into our modern ways in a week; and we may therefore look at their work as we should that of a living architect, and try to read what was in the mind of the designer of this building or that, and ask ourselves, "What was he driving at?" No doubt he was hedged in by limitations similar to those of to-day. Even in the days of the Great Pyramid men could not build without cost, and they have not succeeded in doing so since. The whims of the client must at all times have stolen the architect's sleep. I think Magister Mutius probably found Pliny a very exacting client.

The limitations of site must have influenced all but the Romans, who thought nothing of excavating the hill for the level Forum of Trajan, or levelling up the ground on a gigantic concrete platform for the *Thermae* of Caracalla. The adaptation of a building to its site should engage the most earnest study. An unusual site, whether of shape or level, is the doom of the incompetent architect, but the triumph of the skilful one. From the Athenian Propylaea and Erechtheion to the rock of Mont St. Michel architectural history presents one long procession of buildings whose architects have presented them to the world as monuments of their genius.

Next notice the limitation of material and its influence on constructive and decorative forms. Ascertain the kind of stone procurable, whether in blocks or slabs and their available size, and note how this has influenced the character of the building and given an individual stamp to the buildings of a particular locality. The monolithic window-jamb of a Yorkshire cottage might be compared with the jointed jambs of a Cotswold one, and the influence of the use of flint in the Eastern counties might similarly be noted. Examples of the influence of material on design are to be found everywhere, however, to the seeing eye, and it is not within the scope of this paper to attempt to enumerate them. The point to be emphasised is the extreme importance of the subject to the study of old buildings. The particular tools in use have also played their part in the shaping and decorating of buildings, as in the dressing of stone or the adzing of timber. The use respectively of the chisel or drill in Roman acanthus sculpture, and the adze or chisel in Norman carving, gives a very distinctive appearance to the work. Doubtless there are many other limitations which have helped to determine the character of buildings, and which the student will detect in the particular building under study.

In narrowing our attention to any particular building we shall first of all examine the plan. This is of supreme importance. Within it somewhere, somehow, lies the soul of the building; all else is but the embodiment of it. See how the

various rooms are grouped together to suit the needs of the time, and note particularly the entrance, the hall and the staircase; also the position of the plan with regard to aspect and point of approach; how the levels work out with regard to the site, and how the house sets with the garden. In ecclesiastical and other work the plan in the same way is the key to the building, and merits our first attention.

Having examined the building from within, next see how the plan with which you are now familiar finds external expression. And first of all note the way in which it is roofed and the manner in which the various parts are grouped together. These are matters of great importance in architectural design and must always have been so, and must have been considered by the architect in the arrangement of his plan. How frequently nowadays are they not left to take their chance. It is the more important that the student should give his attention to these matters of massing and grouping, because by this means he is led to study buildings in the solid, and an antidote is in a measure found against the tendency to façade and elevation designing inseparable to the working out of a building on paper.

How much may be learnt from the design of old chimneys and the manner in which they contribute to the conception as a whole; how well was their value recognised by their builders. On the other hand, how often does an architect nowadays consider the disposition of his fireplaces in the plan so that the chimneys rising from the roof may group well together from the more important points of view?

Connected with this subject of roofing and chimneys, as well as with that of gables and turrets and cathedral towers, is that of sky-line. Study at the time of sunset—I will not be so impracticable as to say sunrise—when the purple outline is silhouetted against the sky. And, in like manner, learn the value of simple masses in twilight and moonlight, when the disturbing details are suppressed. From the study of these more general features you come to the details, or it may be that in any particular building it is some detail alone that is worth attention. Every building must, of course, be studied for the features of excellence it possesses, as a bee draws honey only from those flowers which produce nectar, and that critical sense to which I have already referred will prevent us from thinking we recognise them where they do not exist.

There are one or two ways by which I think we may make our visits to old buildings more valuable to us, which I may refer to in passing. And one is to set ourselves to plan and design some building of the same kind that we propose to study. To fully realise the difficulties of an achievement, so as to observe how they have been solved by others, one must make a similar attempt; this will reveal to us what those points are about which we need the help of other minds. Another excellent method of study is to take up some particular subject, such as, for instance, the design of chancel screens, and make a comparative study of it, just as if one were preparing an essay or a monograph on the subject.

I have hitherto considered the study of old buildings from observation and examination with the aid of the note-book only; we must now ask how this may be supplemented by their delineation. I say supplemented, because I think we should not regard old buildings as dead and lifeless forms to be dissected piecemeal. They are organic creations still instinct with antique life, and we must learn to know them before we portray them; we must examine the building as a whole before we begin to devote our especial attention to a part. Now in considering this delineation of old work, there are two factors to take note of, our subject and ourself, and we must be dutiful and just to both.

We must not turn away from the original for the sake of a flourish of the pencil on the one hand, nor need we, on the other hand, suppress any distinctive style of draughtsmanship which we have made our own, and which is rightly the expression of our own feeling and our own individuality.

An ideal measured drawing or sketch is one which truthfully represents the building, but which is at the same time executed with all the verve and character of the draughtsman. There are some buildings which would be barely interesting, as represented by measured drawings, did not the force of draughtsmanship fairly rivet our attention. Indeed, some of the finest buildings, which are fine because of their uninterrupted surfaces of wall and their bold projecting masses, are, if tamely represented by measured drawings, reduced to a few thin ink lines straggling over an expanse of the whitest Whatman paper. On the other hand, measured drawings must be line drawings, and it would be absurd to shade them up to give a suggestion of projecting surfaces in a picturesque fashion, although the reliefs might be systematically indicated by colour washes after the French manner by cast shadows. I think myself, however, it is best to leave the shadows alone. Measured drawings are for architects only—the public do not understand them, and are not interested in them—and architects would at once perceive the relative value of the surface of elevation from the accompanying plans. It is here that the

value of sketching comes in, for it enables us to judge the building as a solid, whilst the draughtsman is justified in making his drawing or sketch expressive of himself as well as representing his building. Affectation and trickiness are to be severely deprecated, and there is enough of both in the draughtsmanship of to-day.

We do not need to picture an innocent old manor-house as a snow building relieved in aggressive outline against the blackness of an inferno. The methods we shall adopt in representing any particular work will depend upon the character of the work and what it is of which we wish to keep a record. If it is a façade, we may make a measured drawing to a small scale; if a decorated sedilia, then one to a large scale; in either case the drawings will be accompanied by a sketch plan showing the position of the part which is illustrated, and the mouldings and details will be drawn out full size. All this will be done fully and thoroughly on the spot. If, on the other hand, it is the grouping of chimney and gable, the play of surface, the picturesqueness of setting, and a hundred other reasons, we shall find a sketch the most serviceable. We may wish to remember the charm of colours due to the use of various materials or some definite scheme of painted decoration, and a water-colour sketch or a tinted pencil drawing will serve us best. Or if the sky-line of some building seen against the evening sky attracts us, some brown paper and a piece of white chalk will be useful.

Our object is to catch and fix some particular point or feature which interested us, some beauty which excited our enthusiasm, and we may seize the means readiest at hand or best for our purpose, as the case may be, our only care being that we possess ourselves of our aim whatever the medium. If we have any artistic power, we shall find it will also lend itself to our self-expression.

Whilst we may well need our colour-boxes for the purposes I have described, we shall not, as architects, require to make water-colour studies of buildings whose charm lies in the tints of old age, the setting of foliage or the accidental colouring of sunset. Of course, as artists, we may indulge in such, but it forms no part of the study of old buildings.

But whatever we do, let us keep clear and active that critical faculty of which I have spoken earlier, so that, whether we are making measured drawings or sketch, we should remain conscious of the weak points of our subject and not lose ourselves in the glamour of its old-world charm. To this end let us write down in our note-book what our thoughts and impressions are at the time we are making our drawings, giving little marginal sketches illustrative of the manner we, at the time, considered the work might have been improved.

As regards the actual *modus operandi*, it would, I know, be impossible to say anything with which you are not already well acquainted. For sketching a block 16 by 10 is a very convenient size. Some prefer cartridge and some Whatman, whilst others would use sketch-books made of metallic paper. A miniature tee-square is sometimes useful for use with the sketch-block for setting up one or two guiding lines, but not to unduly assert itself. If, moreover, the tee-square has a scale marked on it, it is useful for plotting out a plan or measured sketch. Some find cross-ruled paper convenient for this purpose. Pencils should be of good quality, and there is more than one way of sharpening them. It is impossible to give any character to a sketch if they are too hard or too sharp, and if the lead is brought to an edge rather than a point, one can get a greater latitude of stroke by using either the edge or the broad side.

A sketch is not an elaborately-finished pencil drawing; it is an abstract embodying just those features in the original it is desirable to portray. Certain parts will, therefore, be more or less finished in detail, while the rest are merely indicated by a few expressive lines. The lead pencil must be spared as if it were precious, except at those points of telling shade or accent where it may be rich and black. A few colour washes or strokes of coloured chalk may sometimes be useful to record the local colouring of material. Some have done excellent work with graphite, treated like a neutral wash, for indicating light and shade, but it is not a very sympathetic medium. A few dimensions on a sketch, with one or two sketch details in the margin, will make it more useful.

It is, of course, unnecessary to insist here on the value of a complete knowledge of perspective. All measured work should be plotted and drawn out to scale on the spot. Capitals and other curved work may be merely indicated in these drawings and numbered, and large freehand studies in soft pencil, crayon or charcoal made and distinguished by corresponding numbers, which will enable one to finish up the scale drawings afterwards if necessary. Do not assume that everything is set out with rigid accuracy, that the plan is always rectangular, that two halves are alike, or that flowing tracery can be set out from centres. If we cannot perceive the absence of the mechanical in old work, we shall be blind to one of its great charms. Always show the stone jointing of the more important and decorative parts, and of the tracery of

windows, and clearly indicate the treatment of wall surface. In the same way show the jointing and framing of carpentry, and do not hesitate to add explanatory notes to the drawing. Mouldings should always be drawn out full size and carefully measured. Strips of lead and such contrivances for obtaining their contour are worse than useless. Place the arch mould over the jamb mould and show the outline of the caps, and as a rule make all your full-size details as you would if you were sending them out to some mason or carpenter to be executed. They should have a business air about them and not a show-drawing look. If, however, you are proposing to send them in for a prize, arrange them carefully on sheets of uniform size mounted on cardboard, and do not think you are making them look more artistic by some ridiculous and fantastic printing.

The joys and the sorrows of a sketching tour might well claim an essay to themselves, but it might be of service to indicate some of the items of equipment. Of course, pencils, brushes, instruments, scales, colour-box, water bottle, sketch-books and sketch-blocks, tape, plumb-line and level must be included. A 2-foot rule in your pocket is indispensable; so too is a 5/- note. Plenty of drawing-pins—but do not leave them about on cathedral chairs. A sketching stool—a collapsible one—but not while you are sitting on it. A double elephant is naturally too heavy to carry about, but half a double-elephant board, and a roll of paper to correspond, is a useful size. The tee-square will of course be made to suit, and if the board is accurate and square a set-square may be dispensed with; it is only one more thing to forget and leave behind. Callipers will be needed to take the diameters of shafts and mouldings, and a stout piece of copper wire serves as a calliper for larger shafts. A 5-feet or a 10-feet jointed rod is also necessary. By a little ingenuity an American leather satchel can be contrived the size of the drawing-board, with pockets of various sizes, and the whole strapped together with a handle-strap, the sketching-stool, rod and tee-square being threaded through the back, and a leather label attached in case you should leave it all in the train.

With all this equipment, and a few weeks' stay in a good architectural district, you will no doubt enrich your sketch-book, and, what is of still more importance, you will increase your knowledge and educate your taste, which will be reflected in those buildings which you may yourself have to design, and, recognising their charm, perhaps some student of the far-distant future, whose great-grandparents are not yet born, will measure up your work, now mellowed with age and nature's tints, and speak sympathetically of those dear old architects of King Edward's reign, who knew so well how to put their soul into their work.

Mr. W. J. N. MILLARD, who proposed a hearty vote of thanks to the author, said the paper was full of advice valuable to those men who were beginning in the profession, and also to those already in practice. In discussing the paper they might as well go back to the beginning, and test the question, Why study and delineate old buildings at all? The speaker suggested that they wished to know something about the old buildings, but it was well to realise what this meant. Drawings were to be seen of old work which showed little or no desire for acquiring a knowledge of the spirit which gave the building its character. If an architect wanted to know anything of a building he should know everything. There were two kinds of drawing—the perspective view and the geometrical. It might happen that the architect in his sketches wanted to know more than his drawings could tell him, and therefore it was important that he should know the whole life history of the buildings. It was necessary to learn the influences that were at work on the minds of the men who fashioned them. The student of architecture was, therefore, the student of history. It was not enough to draw a building to know its history, but if it was drawn thoroughly the plan would be the root of its meaning. This was especially the case in England, and old churches were found to be the growth of different periods, and the result of a number of men adding to one another's work. An investigation of this kind helped the student to arrive at the life of the building.

Mr. A. MITCHELL seconded the motion. He said the attraction of photography was dangerous to the young architect. The moment a man began to photograph buildings he was lost as a sketcher, and when he ceased to be a sketcher he lost much of the power and interest which could help him in his own work. The critical faculty was one to be cultivated, but it did not seem necessary to offer such advice to members of the Association. The opinions expressed during their afternoon excursions proved this.

Mr. G. LUCAS, in supporting the vote, suggested that sketching seemed the requirement of the modern architect. He questioned whether the earlier architects attained their good results through such study.

Mr. A. T. BOLTON said the young student should measure work before he began to make sketches. The first drawings were often disappointing, and the progress so slow that the

beginner lost heart, whereas in the measuring the student had solid results to show for his labour, and he did in this way learn something about the plan, and had prepared the way towards sketching later on.

The PRESIDENT in putting the vote said the most essential point in the sketching and study of old buildings was to keep the mind on the work, and to try and understand it by analysing the component parts and their relation to one another. Photography could be of real assistance to the architect. There was often a temptation in sketching to make merely a picture of an old building, but aided by a camera an architect could avoid the evil, and by his photographs learn the history which the building offered to him.

Mr. BIDLAKE, in reply, said the plan of an old building presented a problem to study, not being the result of one man's work or the expression of one time. Modern work did not offer the same exercise to the student. By the study of the plan of a building the student, if he was intelligent, would read its history, and through the history of the building he would learn the customs and the social life of the time. The study, therefore, of old buildings absolutely involved the study of history. There was no doubt that the earlier architects made measurements or sketches of work which preceded theirs. Vasari and other authorities mentioned architects who made journeys with that end in view.

### FASHION IN ARCHITECTURAL DESIGN.\*

IN the short paper which I have prepared for discussion I wish it to be very distinctly understood that I am not speaking at all didactically, nor even critically, so much as interrogatively, and that in the points I may raise and the questions I may ask I am interrogating myself quite as much as I am my audience.

It has often been said that a child can ask questions which the wisest man cannot answer, and therefore, *a fortiori*, it must even more frequently be true that a man of ordinary intelligence can raise questions which he himself cannot satisfactory reply to. My object, then, in selecting the question of "The Tendency to Fashion in Architectural Design" as the subject upon which to invite your opinion and testimony has been a very genuine desire for discussion upon this subject, which I think should be of interest to us all. I propose to consider the question of necessity briefly, and therefore suggestively, rather than at all exhaustively, under the following headings, viz.:—1, its acknowledgment; 2, its influence; 3, its causes; 4, its lessons.

1. *Its Acknowledgment.*—I take it for granted that, as human nature is very much alike in its sensations in the average man, it can hardly be a novel experience for anyone who has been in practice for any considerable number of years, to find himself on looking back awaking to a recognition of the fact that vogue or fashion have from time to time played no unimportant part in his judgment in design, so much so, indeed, as to have caused him sometimes consciously, but often partly unconsciously, gradually to abandon one style of treatment in favour of another, not necessarily from any definite principle of new methods of construction or of special local conditions, but rather from the fact that such style of treatment has become the fashion, with the consequent result that after a time he has found himself thinking almost entirely in the current style and judging everything from its canons. Still further is he led to an acknowledgment of this from the fact that so short-lived sometimes has been the duration of such current fashions that he may easily, within his own experience, have found himself working for a period in perhaps three or four styles in succession, and discarding in turn what may in some cases previously have been even specially cherished forms or outlines. As an illustration of what I mean one has only to point out that in English architecture, to which, of course, I am referring, half a lifetime ago Gothic forms were being freely adopted for every class of public building, houses of Parliament, town halls, law courts, hotels and street façades; a few years later and Queen Anne forms and outlines have come into vogue; again, a few years and Romanesque treatment tinges nearly everything; while now a Georgian type is reasserting itself. Without referring specially to Barry's Houses of Parliament, which were, of course, rather earlier, nor to Street's Law Courts, which perhaps helped to kill the style as well as the author, let us ask, Would any one in the present year design a Gothic town hall? Yet most of us remember the acclaim which greeted Mr. Waterhouse's Manchester town hall. Or, again, let us ask, Would the treatment shown in the Romanesque design of Mr. Waterhouse's Natural History Museum or in

\* A paper read by Mr. H. C. Kent, M.A., before the Institute of Architects of New South Wales, and published in the *Building, Engineering and Mining Journal*.

that of Mr. Aston Webb for the Imperial Institute, which many prefer to the accepted design, be put forth by even these same masters to-day? For answer look at Mr. Aston Webb's recent design for the South Kensington Royal College of Science. Again, in Domestic architecture similar phases of fashion have ensued, and at one period of our practice the fullest possible exhibition of all construction has been the vogue, and any wooden boxing and casing have been decried as wanting in truth, while within a few years we are once more calmly contemplating heavily boxed pediments and eaves with mock brackets hung thereto, carried by instead of carrying them, and other finishings which, only a few years ago, were the subject of reprobation. Still again, as applied to internal domestic decorative treatment and furniture, we must all acknowledge that fashion plays so large a part that forms which at one time are regarded with favour in a few years time are looked at with disapproval, and even with distaste. And who will venture to say that a few years hence the forms which are now in favour will not in their turn be eclipsed by a recurrence or modification of some other treatment, perhaps even of Gothic or Romanesque? So much then as to the "acknowledgment" of this tendency to fashion, and now let us consider our second heading, viz. :—

2. *Its Influence.*—The first question which I think one not unnaturally asks oneself after reflection upon the foregoing is something like the following, viz. :—To what extent does vogue or fashion influence our sense of what is beautiful? or, in other words, is educated human judgment so unreliable that forms at one time regarded as beautiful can at another period be thought otherwise? I have said "educated" human judgment, because I am not of course dealing with that first development, or enlightenment which should be the natural sequence of educating anyone for his calling, but rather with that more subtle influence which comes as the result of dealing for any length of time with particular forms and combinations to the exclusion of others. Further, I am using the word "beautiful" in a very general sense, merely as expressing or defining anything that is pleasing or gratifying to the sense of sight, whether rugged or graceful, majestic or picturesque, symmetrical or irregular. Of course already a parallel on a lower plane will have suggested itself to your minds in the application of the same question to the subject of costume. If we wish to gauge the influence which fashion has had upon our power of personal judgment in the matter of "costume," let us look through a photograph album containing photographs extending over the last twenty-five years, and as we smile and make merry over some fashions of costume, either male or female, the peculiarities and extravagancies of which are now so very evident to us, let us ask ourselves why at the date, when these costumes were in fashion, our sense of perception was so far blunted by their currency as to at least partially blind us to a true sense of their grotesqueness, and then with more seriousness further ask ourselves the question which should be one of especial importance in our profession, viz. to what extent is our own judgment of what is becoming or beautiful narrowed and warped by ideas current for the time, that is, by fashion? Since writing the foregoing my attention has been drawn by a friend, to whom I have submitted my notes, to so similar an argument and illustration in the recent work of a very distinguished statesman that I am tempted with, I hope, a pardonable sense of gratified satisfaction to quote therefrom. The Hon. A. J. Balfour, the present Prime Minister of the Empire, in his book on "The Foundations of Belief," treats in his second chapter under the heading of "Naturalism and Æsthetic" on "The emotions excited by the beautiful" and in the course of his argument says, "Let us ask why every 'public' has a taste? And why at least in western communities that taste is so apt to alter? Why is there so much uniformity, and why is there so much change?" and then he illustrates his argument as follows:—"The question of uniformity is best approached at the humbler end of the æsthetic scale, in connection not with art in its narrower and loftier sense but with dress. Everybody is acquainted either by observation or by personal experience with the coercive force of fashion; but not everybody is aware what an instructive and interesting phenomenon it presents. Consider the case of bonnets. During the same season all persons belonging, or aspiring to belong to the same 'public,' if they wear bonnets at all, wear bonnets modelled on the same type. Why do they do this? If we were asking a similar question, not about bonnets, but about steam-engines, the answer would be plain. People tend at the same date to use the same kind of engine for the same kind of purpose, because it is the best available. They change this practice when a better one is invented. But, as so used, the words 'better' and 'best' have no application to modern dress. Neither efficiency nor economy, it will at once be admitted, supply the grounds of choice or the motives of variation. If, again, we were asking the question about some great phase of art we should probably be told that the general acceptance of it by a whole generation was due to

some important combination of historic causes, acting alike on artist and on public. Such causes no doubt exist, and have existed; but the case of fashion proves that uniformity is not produced by them alone, since it will hardly be pretended that there is any widely diffused cause in the social environment, except the coercive operation of fashion itself, which should make the bonnets which were thought becoming in 1881 unbecoming in the year 1892."

Further on he continues as follows:—"It may perhaps be hazarded that this uniformity of practice, produced by a complex group of causes, which we denominate 'fashion,' is a uniformity of practice alone, not of taste or feeling, and has no real relation to any æsthetic problem whatever. This is a question the answer to which can be supplied, I apprehend, by observation alone, and the answer, which observation enables us to give, seems to me quite ambiguous. If, as is possible, my readers have but small experience in such matters themselves, let them examine the experiences of their acquaintance. They will find, if I mistake not, that by whatever means conformity to a particular pattern may have been brought about, those who conform are not as a rule conscious of coercion by an external and arbitrary authority. They yield no unwilling obedience. On the contrary, their admiration for 'a well-dressed person' is, at least, as genuine an æsthetic approval as any they are in the habit of expressing for other forms of beauty, just as their objection to an outworn fashion is based on a perfectly genuine æsthetic dislike. They are repelled by the unaccustomed sight. It appears to them ugly, even grotesque, and they turn from it with an aversion as disinterested, as unperturbed by personal or society considerations, as if they were critics contemplating the production of some pretender in the region of great art."

There is more to the same purpose that I might quote with advantage, were it not for the fear of unduly lengthening my paper. Sufficient will have been quoted, however, I think to confirm my argument as to the reality of the influence of fashion upon taste upon this lower plane, and noting as we have done under our first heading the fact of changes of fashion in architecture, who will venture to deny its influence upon judgment and taste in this higher domain of art? Let us apply them to architecture, the question with which I commenced this heading, and we shall, I think, find food for much reflection as we try to rid our minds of all merely passing influences, and to estimate apart therefrom the beauty or otherwise each of its own kind of differing forms and combinations. Possibly also we shall find a corrective to that tendency to narrowness of judgment which is a temptation that lies in wait for all specialists, and which almost inevitably ensues from concentrating one's thoughts too exclusively upon any particular set of forms or ideas to the exclusion of all others. Let us pass next to our third heading, viz. :—

3. *Its Causes.*—In answer to what has already been said as to changes of fashion in architectural treatment, one may reply that he does not pretend to argue that beauty in architecture is confined to any particular type or style, but rather that as there are many and varied types of beauty in nature so there may be a beauty of its own in each or every recognised style, which brings us to another question, viz. :—If each style possesses beauty, why should it be even temporarily discarded? or, in other words, to what causes are we to ascribe this tendency to fashion? One could better understand changes of style and appreciate them as indicating life or growth if one could give a definite reason or explanation for them by being able, for instance, to trace a natural development of any current style from its predecessors, as was the case in the development of English Gothic, or if such change were always due to more modern methods of construction, as was the case in the change from trabeated to arched design; but while one can sometimes see or think he sees traces of the influence upon style of the adaptation of certain materials to new or altered uses or to later methods of construction, I think one must look elsewhere for the true explanation or reason for the frequent changes of style noticeable in recent years. Restlessness and the love of novelty have, I think, something to do with such frequency, for we live in a restless and excitement-loving age, an age in which an artist will vary rather than be guilty, as he thinks, of repetition, and so will vary for the better if he can, but possibly even for the worse rather than not at all; added to which is, I think, one very potent factor which I do not think has been previously expressed, viz. the loss of pleasure in any previously favoured treatment which our master artists must suffer from the contemplation of vulgarised and perhaps grotesque reproductions of their creations in all sorts of inappropriate as well as appropriate places. Under the previous heading I spoke of the parallel on a lower plane in the application of the same questions to "costume," and under this heading the same illustration may be further applied. A costume with some new, and perhaps artistic emphasis of form or colour, is introduced by the creators of fashion, and what is the result? Before the end of its currency its emphasis is exceeded and out-emphasised in blatant and vulgarised forms until the artistic originators

must in some cases shudderingly revolt from their own creation, and as far as possible alter every combination of form and colour in their next effort. This explanation will, I think, apply not only to general architectural design, but with even greater force to Domestic architecture and decorative treatment, and a due consideration and digestion of it should help to correct our tendencies towards novelty purely for novelty's sake, which are always dangerous from an artistic point of view, and are liable, especially in a self-advertising age, to degenerate into the vulgarity of primarily considering not so much what is beautiful as what will attract attention, a principle as destructive of true art as pot-boilers are of true painting or novelettes of true literature. And now let us as briefly as possible consider under our last heading;

4. *Its Lessons.*—Under our second heading, it will be remembered, we asked:—"To what extent does vogue or fashion influence our sense of what is beautiful?" Now, before we can deduce from our subject any lessons to help us at all, we must, I think, first ask the more important question, What constitutes beauty in architecture? I have already suggested that some may say, that as there are various types of beauty in nature, so there may be a beauty of its own in each or every recognised style of architecture; to which I may add that as in nature one type of beauty appeals more to one and another to another, so also in architecture one style may not unnaturally appeal more to one and another to another, from which in passing one may deduce the simple first lesson of exercising due allowance towards the opinions and tastes of other qualified critics, and of avoiding the narrowness of setting up one's own personal predilection or taste as the sole gauge of what is beautiful. Granting this variety of type, however, there still surely must be consistently therewith certain underlying principles or canons of judgment as to what is beautiful in architecture applicable to all styles having any claim to consideration, and independent of all mere changes of fashion, and which should appeal as effectually to the educated eye as the canons of musical harmony do to the educated ear. I may remind you again that I am using the word beautiful in no special sense, but merely as expressing that which is pleasing or gratifying to the sense of sight. In considering, then, canons of judgment as to what constitutes beauty in architecture, I would point out, first, that an architect has, I think, to deal with four elements capable of beauty, viz. material, form, enrichment and colour, and that he has four conditions to consider in producing beauty from these elements, viz. purpose, congruity, proportion and harmony. Let us look first at the four elements capable of beauty. There is, of course, capacity for beauty in some materials themselves, independently of form or enrichment. Capacity for beauty in form needs no explanation, this being the architect's necessary element, while capacity for beauty in enrichment and in colour may be considered as to some extent his luxuries. And now let us consider the four conditions which I have named for the production of beauty from these elements, viz. purpose, congruity, proportion and harmony. Purpose, I would define as the reason or intention which the various parts of a design should manifest. Congruity, I would define as appropriateness or fitness for its intention. Proportion, as the relation of parts in a design in respect to size or quantity. Harmony, as the relation of parts in respect to quality. Now, it will be found that these four conditions may be applied to each of the four elements which, perhaps, may be most easily illustrated by negative examples. For instance, as regards "purpose," there may be want of purpose in reference to materials, *e.g.* in using a perishable material in a wrong position; there may be want of purpose as regards form, *e.g.* in that not uncommon feature of attaching columns to the front of a building and letting them carry nothing but their own width of entablature; and there may be purposelessness in enrichment or colour, *e.g.* in providing these in wrong places. Again, as regards "congruity," there may be incongruity in reference to materials, *e.g.* in building a stable or bulk store of costly marble; there may be incongruity in reference to form, *e.g.* in designing either with the outline of a Greek temple; there may be incongruity in reference to enrichment or colour, in bestowing chaste carving or high-class colour decoration upon such buildings. Again, as regards "proportion," there may be disproportion in the use of two materials, such as brick and stone, in an elevation; there may be disproportion of form, of course, in every relation; there may be disproportion of enrichment in respect to quantity, for instance in overloading, and there may be disproportion of colour in quantity, *i.e.* in the predominance of any colour or colours quite apart from their harmony. Lastly, as regards "harmony," *i.e.* the relation of parts in respect to quality; there may be a lack of harmony in the use of materials, *e.g.* in using slates and shingles together on a roof; there may be lack of harmony in form, as *e.g.* if one were to insert Gothic windows into the Royal Exchange or the Bank of England; there may be lack of harmony in enrichment,

*e.g.* in bestowing delicate carving on a coarse and cheap material; and lack of harmony in colour, of course, needs no illustration.

You will observe that in this question of what is beautiful we are dealing, of course, with the æsthetic side of architecture only, and are leaving out of consideration altogether the practical side, though it will be noticed that even on the æsthetic side, under the condition which I have called "congruity," the eye is dissatisfied with any inappropriateness or unfitness for its intention in a building. To enlarge at any length upon these elements and conditions would be, of course, to write a volume instead of a paper. I wish, however, to refer briefly to two of these conditions which I think bear more particularly upon my subject, viz. (1) Purpose, and (2) one attribute of proportion which I may call "Restraint." "Purpose" I have already defined as the reason or intention which the various parts of a design should manifest.

It is the desire for "purpose" which makes the child, the untutored ask, for example, "What is that thing for?" as they watch a corbel placed in position, and which leaves the eye unsatisfied in respect thereto until it sees the roof principal bearing thereon. Now, I think you will agree with me that if this condition of "purpose" or reason be faithfully applied to each and every feature that we may adopt, one corrective to the influence of mere fashion will always be at hand, for while we may hail and adopt with pleasure any new adaptation of form or material that has reason and purpose behind it, we shall hesitate to follow what may be a questionable because a purposeless effect. By "restraint" I mean that educated sense which in a well-balanced and refined mind checks tendencies to excess or extravagance in the uses of material, form, enrichment, or colour. It is this attribute of "restraint" or moderation which intuitively prevents the refined lady from rushing to extremes of fashion in costume, and which, with no less potency, should restrain the refined and true artist from the degeneracy to which I have already referred of primarily considering, not so much what is beautiful, as what will attract attention. It tends always to the side of simplicity rather than complexity, and is an element of that self-mastery which is one of the highest results of all true education.

To sum up, then, I think that among the various lessons which our subject suggests not the least important are the following:—(1) The avoidance both of narrowness and arrogance in judgment. (2) The application especially of the principle of "purpose" to all parts of our designs. (3) Restraint and freedom from excesses and all mere eccentricities—lessons which, may I say, I am conscious of requiring to apply to myself probably more than to my audience, and which, if my paper has served no other purpose, it has helped to bring before my own mind in more definite form.

#### EDINBURGH ARCHITECTURAL ASSOCIATION.

AT a meeting of the Edinburgh Architectural Association on the 17th inst. Mr. Thomas W. Aldwinckle, F.R.I.B.A., London, delivered a lecture on the erection of isolation hospitals in times of emergency. The lecture was for the most part a description, illustrated by plans, of the hospitals erected in connection with recent epidemics in London. In the course of some introductory remarks he described the general methods of building a hospital under pressure of an epidemic such as the Metropolitan Asylums Board had to contend with this year. In order to build a properly equipped infectious hospital in a few weeks, the ordinary procedure, he said, would be quite out of the question. There was no time for elaborate plans, for bills of quantities or for inviting tenders by advertisement. The architect selected should be thoroughly conversant by previous experience with this class of work, and it was equally important to have an expert and trustworthy builder. As there was no time to enter into a contract for a fixed sum, the amount to be paid to the builder must be based upon a schedule or left for valuation. There was one important question which arose in connection with these emergency hospitals about which there was considerable difference of opinion—whether the buildings should be made of as permanent a character as possible, consistently with speed of erection, or be "knocked up," so as to last a short time and be afterwards pulled down. Much depended on the circumstances of the case. The cheaper method of building was considered advisable by some on the grounds, firstly, of economy, and secondly on the ground that the sooner an infectious building was destroyed the better. As to the latter, there were now no difficulties in the way of thoroughly disinfecting a building; as to the former, he doubted whether it was a true economy. Personally he was strongly of opinion that the truest economy was to erect those emergency hospitals in as permanent a way as would be consistent with a high rate of speed. It might be taken for granted that if the isolation hospital was wanted at the present time it would be wanted in the future, and

if such be the case the permanent construction was the truest economy. It should also be borne in mind that the whole of the sanitary arrangements must be good, and consequently expensive, and that all these would be practically wasted in a merely temporary building. Referring to the details of construction, he advocated a good platform of cement for the whole building; the walls and partitions of fir quartering, with the outer walls covered with diagonal boarding, felt and corrugated iron. The roof, which should be of the ordinary timber construction, should also be covered with diagonal boarding, felt and corrugated iron. The internal finishings were also described in detail. He did not, he said, admit the principle of a second quality in sanitary work. The patients were just as ill in a temporary as in a permanent hospital, and required the same advantages of perfect sanitation. The same remark applied to warming and ventilation. It was preferable to warm by means of open fireplaces, supplemented by low-pressure hot-water or steam apparatus. It took some time to build brick fireplaces, and sometimes this was not practicable, but a great effort should be made to provide these, as an open fireplace was after all about the best exhaust ventilator that could be found. It was of vital importance that as emergency hospitals were somewhat more inflammable than an ordinary permanent hospital, very complete and adequate fire-extinguishing appliances should be provided, as also a complete system of fire-alarms. In concluding, Mr. Aldwinckle gave particulars of an emergency hospital of 612 beds he had erected this year for the Metropolitan Asylums Board, together with its administrative staff quarters and administrative buildings at Gore Farm, near Dartford. His firm was instructed on January 9. It was arranged (in case of fresh developments of smallpox) that the new hospital should be opened in stages as completed, so that no time should be lost. The boiler-house, laundry and kitchen were ready on February 22, the ten temporary ward pavilions a week later, the administrative block on April 7, the six staff homes and eleven ward pavilions on April 21, and the remainder of the hospital on May 3. The number of men employed was 2,600; 6,000*l.* was spent in providing sleeping huts for some 1,100 men, and about 1,200*l.* in having them vaccinated and in other incidental expenses, the new hospital being close to one that was full of smallpox patients. The erection of isolation hospitals in times of emergency was very costly. That such emergencies should occur demonstrated the extreme difficulty of accurately estimating the margin to be allowed in the provision for infectious diseases, and more especially in the case of smallpox, the course of which was most erratic. This applied alike to large and small communities, and as these emergencies were not only possible, but probable, it would always be useful to understand the best methods by which to grapple with them, and thus prevent an outbreak from developing into an epidemic, a result which the Metropolitan Asylums Board had fortunately been able to achieve in connection with the visitation of smallpox in London during the present year. Over the meeting, which was well attended, Mr. A. Hunter Crawford presided. In the course of the evening the services of Mr. T. Fairbairn, who had been hon. secretary for twenty years, were acknowledged by a presentation, which was made to him by Mr. Thomas Ross, on behalf of the Association.

#### EDINBURGH SCHOOL OF APPLIED ART.

THE annual exhibition of work executed by the students of the School of Applied Art at present on view in the galleries of the Royal Scottish Academy is undoubtedly one of the most comprehensive and interesting displays of the kind that the school has yet produced. The galleries are hung from end to end with line and colour drawings, and there is an overflow upon screens on the floor. It seems, however, that what is shown is, says the *Scotsman*, only a part of the harvest of the year—a fact proving the school to be in a state of healthy activity, and that the students are no laggards in their work. It may incidentally be said that despite the withdrawal of the grant by the Town Council, which formed a considerable part of the resources of the managers, the school has begun its present session under the direction of Mr. Alfred Greig, who was appointed headmaster last year, with every promise of continued success. The fees to students had to be raised, but the high position the school has taken as a practical educative centre has been so well recognised that there was no diminution in the number of applicants for admission. The session, indeed, opened with the largest attendance—viz. eighty pupils—that has ever been enrolled, that being the maximum of pupils that can be accommodated in the classrooms in the Royal Institution. The morning class, which meets every morning at 8 o'clock, is quite full, and the evening class, which assembles four times a week from seven to nine o'clock, has also practically its contingent of students. There has been so

much discussion about this school lately that in order to enable the public to judge for themselves as to the position it occupies in the scheme of art education in Edinburgh, the work done by the students has been hung in complete sections, which give an excellent idea of the system of training extended to the various grades from the first to the fifth year of the curriculum. Under the first group are studies of the elementary and the more advanced principles of design executed by students of the various years, also studies in perspective, sciography, and sketching from the cast. Here likewise are shown the works of the figure and colour classes, these comprising charcoal drawings from the antique, and studies in water-colour from grouped models, flowers, &c. The colourwork is particularly good, the restrained handling employed being that best suited for decorative effect. The second group is filled by works of the Saturday afternoon sketching classes, consisting of measured drawings and sketches of some of the best existing examples of Scottish art to be found in the neighbourhood of Edinburgh in stone and metalwork, furniture, carving, &c. The third group comprises the work of the modelling class, viz. works modelled in clay from casts of historic ornament. The fourth section is devoted to holiday work. Small money grants are made to the best students for the purpose of study during the holiday season, and the drawings made under these conditions, consisting as they do of examples of art in stonework, woodwork, metal, glass and colour decoration from all parts of Scotland and England, form a most interesting feature in the exhibition. Then there are travelling scholarships awarded to students at the completion of their curriculum for the purpose of four months' study in the United Kingdom, and the work sent in by these bursars this year is particularly worthy of notice for its variety of feature and high quality. A group of drawings by Mr. David C. Ramsay, furniture designer, studied for the most part at South Kensington, shows excellent draughtsmanship, and an appreciation of the beauty of French and other furniture; Mr. James Gillespie and Mr. Will Davidson, architectural draughtsmen, exhibit work also of merit, comprising a large number of measured drawings and sketches of some of the finest Ecclesiastical and Domestic architecture in England. Mr. Davidson also contributes some excellent studies in colour of ancient stained glass and colour decoration from chancel screens in Norfolk. Lastly, there is a group of drawings connected with what is called the National Art Survey of Scotland. These consist of measured record drawings of Kelso, Jedburgh and Melrose abbeys, and various examples of Scottish Domestic architecture, prepared during the past year by the students who gained this scholarship—these drawings remaining the property of the school. It will be seen from this summary of the contents of the exhibition that a wide range of important study is covered in this school, which its directors hope will not be lost sight of in any arrangements which may be made in the near future for art education in Scotland.

#### THE VICTORIA MEMORIAL AT NICE.

A CORRESPONDENT of the *Times* at Nice writes:—The Queen Victoria Memorial on the Riviera, for which subscriptions were collected last year, is for the present a serious subject of contention, as the form which the memorial shall take cannot be decided upon to suit all the subscribers. A memorial committee was formed last season at Nice under the presidency of the British Consul, and at a public meeting it was decided that the most useful and appropriate form of memorial to Her late Majesty would be a cottage hospital in or near Nice, which should be available for English-speaking patients, irrespective of creed. This proposal, though carried by a great majority of those persons present at the meeting, did not meet with the general approval of all the old British residents, who were in favour of a less ambitious scheme and one more within their means. The hospital idea has nevertheless been adhered to, and at a recent meeting of the memorial committee it was decided to commence building as soon as the sum of 2,000*l.* was in hand. A circular letter, signed by many of the old residents, has now been issued, objecting to this decision of the memorial committee on several grounds. It is contended that far too small a sum is mentioned as enough to erect and maintain even a small hospital of eight or ten beds, and it is pointed out that the only land suitable for such a building in or near Nice would cost at the very least some 500*l.* This is allowing for legal expenses and counting as enough a small plot of land about a sixth of an acre in area, but without reckoning the cost of building, which for bare bricks and mortar could scarcely be less than 1,900*l.*, making a total for land and unfurnished building of 2,400*l.* Then as to the income necessary to maintain even this small establishment, it is calculated that 450*l.* to 500*l.* at least would be required, of which at present only about 150*l.* is promised. There are also the unforeseen expenses which inevitably

arise in connection with every institution of the kind, and it is asked where this considerable sum is to come from. In addition, there is a question as to whether there is sufficient necessity for this hospital to justify the financial risk referred to, as the existing Asile Evangélique at Nice, with thirty-eight beds, takes in Protestant patients of all nationalities. The Asile is managed by a committee, of which the President and half the members are English; it owns a Victoria Ward in commemoration of the Diamond Jubilee; and has been visited by many members of the Royal family. For surgical cases at Nice there is the new hospital built by Prince d'Essling, and for poor English Jews there is the well-managed Jewish hospital at Cimiez. The only real need seems to be for the few cases of illness amongst poor Anglo-Saxon Roman Catholics, and this might be met at less expense than the starting of a new hospital. Another great objection to the Victoria Memorial Hospital scheme is the growing difficulty with which English and American doctors obtain permission from the Government of France to practise their profession in that country. In the face of these facts, it seems likely that the Riviera Victoria Memorial may take some form less ambitious and more likely to do permanent good, unless some British philanthropist will establish the hospital scheme on a firm business basis by the gift of, at least, 5,000*l*.

### TOWER OF BIRKENHEAD TOWN HALL.

ON the 17th inst. a special meeting of the Birkenhead Town Council was held. It was proposed that Mr. Henry Hartley, of Liverpool, be appointed architect in connection with the reconstruction of the town hall tower. Mr. G. P. Snape said that he thought a good deal of money had been lost over the tower, and he desired to know now whether it was intended to alter the original design of the tower. He also asked what the tower had cost up to the present. Mr. Robinson replied that the approximate cost up to the present was a little over 700*l*. With regard to the design, they asked for the appointment of an architect who would submit plans to them. They wished the architect to have an entirely free hand, and the committee were not biassed in any way. The Council for the purpose of discussion then went into committee. In reply to Mr. A. E. Grice, Mr. Robinson said there was a feeling in committee that a modification of the old tower would be desirable, but there was a unanimous feeling that the clock part of the tower should be retained. Mr. E. A. Tooth suggested that competitive designs should be submitted; they had good architects in Birkenhead, and they might be given a chance. Mr. Robinson said Mr. Hartley was the unanimous recommendation of the committee; while as to the suggestion of competitive designs there would be a further waste of time. Further, Mr. Hartley superintended the pulling-down of the tower, a highly technical and dangerous work, which was carried out most satisfactorily. Several others having spoken, Mr. Robinson replied to the whole discussion. He said the finance committee wanted to first appoint an architect, then get the design and estimate, and then this would be submitted to the Council. Mr. Snape moved that the recommendation be referred back in order that the Council might have a fuller report with expert advice in the matter. Mr. Tooth seconded. The amendment was defeated, and the proceedings were confirmed.

### UNDERGROUND WATER PRESERVATION ASSOCIATION.

THIS Association, which was the Kent Water Preservation Association, has been formed for the purpose of preventing the abstraction of water by water companies to the detriment of landowners, millowners, householders and others, and for conserving the waters of any district when they are required for the use of its own inhabitants. It is stated that for many years certain geologists imagined the London basin to be composed of a series of chalk beds under the London clay, and these beds were supposed to be full of water and practically inexhaustible. But facts now derived from regions in or near that basin show that this is not the case, and that in many cases the water is rapidly becoming exhausted. This deficiency has been almost universally attributed to lack of rain, but one of the objects of the compilers of this pamphlet is to show another cause of what has already become a very disastrous state of affairs in the home counties and in many other parts of the country. The report drawn up by Mr. Urban H. Smith, C.E., on this subject refers to the disastrous results of depletion of the springs by pumping. Among the chief objects of this Association the following are given:—(1) To suggest the best

course to be adopted for preserving the water supply under the special circumstances of any particular case; (2) to suggest the best position for locating pumping stations with a view of doing as little injury as possible to local interests; (3) to suggest the best course to be adopted in storing for domestic purposes, the ordinary rainfall; and (4) to take all possible steps to prevent water companies from obtaining money and powers from Parliament for the erection of pumping stations in districts where there is a shortage of water, and where such pumping operations threaten to deprive the inhabitants of the district of their natural supply.

### GENERAL.

**M. Stanislas Meunier**, the French geologist, has reported to the Académie des Sciences that a volcano, as yet inactive, exists beneath the Boulevard St. Martin and the Place de la République, Paris.

**The Prince of Wales** has forwarded 10*l*. to a fund which is being raised for the restoration of the parish church of Wymondham, Norfolk.

**M. Josef Israels**, the Dutch painter, has been elected a foreign associate of the Académie des Beaux-Arts in succession to the late Marc Antocolsky of St. Petersburg.

**The Proposed Monument** to Dante in Rome will cost 40,000*l*.

**M. Emile Ulmann**, the French architect, has died in Paris in his fifty-eighth year. He obtained the Prix de Rome in 1871 and in 1896 was awarded the medal for domestic architecture.

**Mr. Thomas Brock, R.A.**, has been commissioned to execute the Nicholson memorial statue which is to be erected at Delhi.

**The Director** of the French School at Athens has been reappointed by his Government for a fresh period of six years.

**The Earl of Rosebery** has accepted the presidency of the Buckinghamshire Architectural and Archæological Society.

**The Statue of James II.** which used to stand in Whitehall Gardens, and afterwards on the south-east side of Whitehall, is to be again set up, but the position has not been determined. The statue is generally accepted as the work of Grinling Gibbons.

**Mr. G. R. Macdougall**, of New York, has presented a sea picture by Mr. John Wilson, R.S.A., to the Scottish National Gallery at Edinburgh.

**The Temporary Footways** at London Bridge have been subjected during several days past to extreme tests by means of waggons of cut stone, engines, cranes, &c., and it is expected that in a few days the footways will be available for public use.

**The Seine General Council** have agreed to issue a loan of 180,000,000 frs. for public works, the principal of these being the extension to St. Germain of the avenue from the Arc de l'Etoile to Courbevoie.

**The Record** of the year's meetings and excursions by the archæologists of the Upper Norwood Athenæum has been published. The papers have appeared in *The Architect*. During 1901-2 the region explored has been expanded. The self-reliant efforts of the committee to popularise archæology deserve encouragement. The volumes of the record will form an interesting addition to most libraries.

**The Sedgley School Board** have approved the designs of Mr. S. H. Eachus, architect, of Wolverhampton, for a new school to accommodate 350 girls, as well as designs for a cookery and laundry centre, a caretaker's house and for the rearrangement of the present school at Mount Pleasant.

**The Discovery** of extensive beds of potters' clay of excellent quality on the Silverton estate, near Pretoria, Transvaal, is likely to lead to the local manufacture of pottery, porcelain and such like ware. The matter has been taken in hand by certain enterprising residents with the view of starting the manufacture on a proper scale, information which is worth noting by firms interested in supplying the necessary plant.

**The Memorial** to Queen Victoria in Whippingham Church, which takes the form of rich ornamentation and enlargement of the sanctuary, was dedicated on Tuesday morning by a special service, conducted by the rector, Canon Clement Smith.

**The Technical Instruction Committee** of the Blackpool Town Council have decided to offer premiums of 60*l*., 25*l*. and 15*l*. for the best designs for a school to be erected on the Raikes Hall site. The scheme will include a lecture hall to seat some 400 persons, and all the requirements of a technical as well as of a secondary school are to be provided for.

THE

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

ASHTON-IN-MAKERFIELD.—Dec. 31.—Designs, &c., are invited for the enlargement of the Infectious Diseases Hospital. The architect whose plans are accepted and approved will be retained by the Council to carry out the work at the usual professional charges. Plan of the hospital site, together with full particulars of the alterations and extensions required, may be obtained from Mr. T. Burgess, surveyor, at the Council Offices.

BRIDGWATER.—Feb. 28.—Plans, specifications and estimates are invited in competition for power and appliances to deal with the accumulations of silt in portions of the river Parrett. Mr. W. T. Baker, town clerk, King Square, Bridgewater.

CAPE TOWN.—Jan. 31.—The Council of the University of the Cape of Good Hope invite designs for the erection of university buildings. Premiums of 400*l.*, 200*l.* and 100*l.* will be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

HULL.—Mar. 31.—Designs in competition are invited for the extension of the town hall. Premiums of 300*l.*, 200*l.* and 100*l.* are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

KINGSTON-ON-THAMES.—Jan. 15.—Plans and designs are invited for a central home and cottage homes for children of both sexes in the Kingston Road, in the parish of New Malden. A premium for the first three selected plans of 25*l.*, 15*l.* and 10*l.* respectively is offered. Mr. Jas. Edgell, clerk, Union Offices, Coombe Lane, Kingston-on-Thames.

ST. IVES, CORNWALL.—Jan. 31.—Competitive plans are invited for the erection of municipal buildings, to consist of a guildhall, council-chamber, jury room, public hall, town clerk's office, surveyor's office, treasurer's office, muniment room, parochial office, mayor's parlour and fire-brigade station and offices. Premiums of 70*l.* and 30*l.* respectively will be awarded to the architects whose plans and specifications are considered to be first and second in order of merit. Mr. Edward Boase, town clerk, Town Clerk's Office, St. Ives, Cornwall.

SUTTON COLDFIELD.—Feb. 20.—Designs are invited for the erection of a town hall adjoining the council house, the total expenditure to be limited to 7,000*l.* Premiums of 50*l.*, 30*l.* and 20*l.* respectively will be awarded for the three best designs in order of merit. Mr. W. A. Clarry, C.E., borough surveyor, Council House, Sutton Coldfield.

## CONTRACTS OPEN.

THE Weymouth Council has applied for permission to borrow 44,800*l.* for electric supply purposes.

THE extensions of the electric-lighting mains were authorised at the last meeting of the Reigate Town Council.

A LOCAL GOVERNMENT BOARD inquiry has been held in Sunderland for leave to borrow 74,000*l.* for purposes of electric lighting.

THE Local Government Board has sanctioned the raising by the Tunbridge Wells Town Council of a loan of 10,000*l.* for electric light purposes.

THE Burnley Corporation has instructed the borough engineer and borough electrical engineer to prepare plans for electric tramway extensions.

AN inquiry has been held into the Wallasey Urban District Council's application to borrow 52,350*l.* for electric supply and traction purposes.

THE Derby Town Council has appointed Mr. C. H. Wordingham, of Manchester, to report upon the various sites for the proposed tramways electric generating station.

PROFESSOR KENNEDY has been selected by the Kilmarnock Council to prepare a report on electric lighting and tramways.

THE Walsall Town Council has adopted the recommendations that electric-lighting mains be laid in certain streets at an estimated cost of 6,350*l.*, that a transformer sub-station be provided at an estimated cost of 3,700*l.*, and that application be made to the Local Government Board for a corresponding loan of 10,050*l.*

### BUILDING AND BUILDERS.

A LOCAL GOVERNMENT BOARD inquiry has been held into the application of the Colne Corporation to borrow 9,569*l.* for baths and wash-houses.

THE Local Government Board has held an inquiry regarding the application of the Kingswinford Rural Council to borrow 67,000*l.* for sewerage and sewage disposal purposes. The sewage farm, including compensation, would cost 13,075*l.* of the total outlay.

THE Wavertree (Liverpool) City Council has adopted a proposal recommending the erection of public baths in Picton Road and Glynn Street, and application is to be made to the

Local Government Board for sanction to borrow 26,000*l.* for the purpose. The estate committee were authorised to accordingly appropriate a piece of land.

SUNDERLAND watch committee have had before them plans from Messrs. W. & T. R. Milburn, for Mr. H. Rudland, for a new theatre, to seat over 2,000 persons, on ground once occupied by the old Star Music Hall and other properties in Upper Sans Street. The plans have been approved by the committee. Plans have also been approved by the building committee for alterations and improvements to the People's Palace.

THE property committee of the Bridlington Town Council have submitted a scheme of proposed extension of the Parade northwards by 210 feet, in a line with the present Parade, showing no seaward extension. Provision was also made for a pavilion to accommodate about 2,000 people, with café and shops. The scheme also provided for the terracing of Victoria Jetty sea defences, with provision of a public shelter, the estimated cost of the work being 26,238*l.*

MESSRS. BAYLISS, JONES & BAYLISS, nut and bolt makers, have taken land on the east side of the river Usk, and are about to erect extensive works there. Recently Messrs. Nettlefolds decided to erect other works right on the seaboard. They purchased the Great Western wharf on the Usk, at Newport, which has siding accommodation in touch with the Great Western Railway, and they are now erecting large works there. It is understood that yet another firm has also taken land, or is about to do so, at Newport. Messrs. Bayliss, Jones & Bayliss are also extending their Wolverhampton works, and are laying down a powerful electric-lighting plant.

At a recent meeting of Chester Town Council the housing of the working classes committee submitted a plan and estimate for twelve cottages, with a recommendation that they be sent to the Local Government Board for approval, with an application to borrow 2,160*l.*, the estimated cost. Mr. John M. Frost contended that they would not be able to let the cottages they were proposing to build profitably at a rent of 2*s.* 6*d.* to 3*s.* a week, and cottages at those rents were what was required in Chester. Alderman Churton took the same view, but favoured a small experiment in this direction. They must, however, be careful as to how far they were philanthropic with the ratepayers' money. Mr. S. Moss, M.P., and others, supported the recommendation, which was carried without a dissentient.

Gilbert Wood & Co. Ltd., 6-11 Imperial Buildings, Ludgate Circus.

At a meeting of the Walsall School Board on the 17th inst., Mr. J. Armstrong presiding, it was decided, on the recommendation of the building committee, to forward plans for the erection of a new school and cookery kitchen at the Pleck for the approval of the Education Department. Dr. Lynch said as it was recognised that the Church party were the governing body on the Board, he would like to acknowledge the extraordinarily generous policy pursued by them in providing extra accommodation. Estimating the population of the borough at 92,000, the number of school places provided should be, according to the Education Department's general rules, about 15,000. At the present time the permanent elementary school accommodation in the town was 15,570, and the Board had committed themselves to schemes for providing new schools which would increase the accommodation by over four thousand places. In this they had provided for the requirements of an increased population of about 25,000, and when the new educational authority took office there would be no need for them to erect any new schools for ten or twelve years.

### VARIETIES.

THE Burslem gas committee are considering the advisability of installing a Dellwik water gas plant, and have instructed the engineer, Mr. H. Peaty, to arrange for their seeing the plant at one or two works where it is in operation.

AT a special meeting of Barrow Town Council it was announced that the summer meeting of the Iron and Steel Institute will be held at Barrow next year, when Mr. Andrew Carnegie, who has arranged to be in England at the time, will be president. This is the second visit of the Institute to Barrow, the first occasion being in 1874, when the late Duke of Devonshire, the first president of the Institute, was in the chair.

AN open competitive examination for not fewer than twelve situations as assistant examiner in the Patent Office, will be held by the Civil Service Commissioners in February next. The examination will commence on the 17th of the month, and forms of application for admission to it will probably be ready for issue in the course of a few days; they will be obtainable on request addressed by letter to the Secretary, Civil Service Commission, Burlington Gardens, London, W.

THE St. Bride's Press, Ltd., who are the proprietors of the *County Council Times*, the official organ of the County Councils and of various educational associations, will publish on the first day of the New Year a weekly paper to be called "Education, Primary, Secondary and Technical," which will deal mainly with the work of the authorities under the Education Act.

AT a meeting of the Glasgow Archaeological Society held in the hall of the Philosophical Society, Bath Street, Professor Cooper presiding, it was agreed, on the motion of the chairman, to record in the minutes the Society's sense of the deep loss it had suffered by the death of Emeritus Professor Young, a former president. On the motion of Mr. George Neilson, it was remitted to the Council, as a committee with powers, to confer and take joint action with the Philosophical Society in supporting the Scottish Text Society's endeavour to attract more public attention in the West of Scotland to early Scottish literature. The Hon. John Abercrombie afterwards read a paper on "A Method of Arranging British Bronze Age Ceramics in Chronological Order."

THE first of two consumptive sanatoria erected by the Glasgow District Lunacy Board for the treatment of consumptive patients among the insane was opened on the 16th inst., in proximity to the general asylum buildings at Gartloch, which are situated about six miles to the east of Glasgow. The other was opened on the 18th at Woodilee Asylum, which is situated a few miles further to the east of the city. These sanatoria are exceptional in respect that they have been constructed entirely of composite wood and iron, building materials involving very much less cost than would have been necessary in erections composed of brick or stone. The General Lunacy Board sanctioned their erection in the month of June last, and now, so satisfied is this authority with the substantial and comfortable appearance and with the promise of durability which the institutions present, that they have recommended the Edinburgh District Lunacy Board to take steps for the erection of similar buildings at Bangour to meet the present and prospective needs of Edinburgh district.

SURVEYS for the Manitoulin and North Shore Railway route in Canada are now complete, and tenders for the construction of the railway are about to be called for, so as to have everything ready for an early beginning in the spring. A railway to the Pacific Ocean is to be built in connection with the

Grand Trunk Railway Company of Canada, but constructed under a separate corporate name, and called the Grand Trunk Pacific Railway. The line is intended to extend from North Bay or thereabout through New Ontario, Manitoba, Saskatchewan and Alberta, by way of the Peace River or Pine River Pass, and through British Columbia, reaching its terminus on the North Pacific Coast, probably at Fort Simpson or Bute Inlet. The railway is to be of an excellent modern standard, with low grades, long tangents and heavy rails, all elements of economical working. After leaving Manitoba the line will run almost north-west, tapping the rich Battleford and Edmonton country and the districts of Athabasca and Northern British Columbia.

### TRADE NOTES.

THE Empire Boiler and Engineering Company, Ltd., Halifax, have constructed two rivetted Trentham boilers for the Royal Berkshire Hospital, Reading, which are being fitted at the hospital by Mr. J. T. Spencer, of Reading.

THE tender of the Columbian Fireproofing Company, Ltd., 37 King William Street, E.C., has been accepted for the fire-proof floors at the new building about to be erected on the site of Nos. 11 and 12 Finsbury Square. The architects are Messrs. Hesketh & Stokes, F.F.R.I.B.A., of 110 Cheapside, and the builders Messrs. Perry Bros., Cambridge Heath.

THE inhabitants and tenantry on the Middleton estate at Settrington, near Malton, Yorks, have given Messrs. Wm. Potts & Sons, clock manufacturers, Leeds, an order to make and fix a new eight-days' hour-striking clock, showing the time upon one large external dial, to be erected in the tower of the parish church to the memory of the late Dowager Lady Julia Middleton, of Settrington House. It is to be fixed at an early date.

### BACTERIAL TREATMENT AT REIGATE.

COLONEL COKE, R.E., held a Local Government Board inquiry on the 10th inst. into an application of the Reigate Corporation for a loan of 14,000*l.* for works of sewage disposal. The Town Clerk stated that it was proposed to adopt the bacterial system, as the method of precipitation followed by land treatment had given rise to serious complaints owing to the land having become sewage sick.

Accordingly in 1898 an experimental bacteriological installation was laid down, various methods being tested, and so satisfied were the Council with the results obtained from bacterial oxidation beds fed with the Candy sprinklers that they desired to carry out that system for the treatment of the whole of the sewage of the borough. Samples of the effluent obtained from the system they proposed to adopt had been analysed by Dr. Jacob, medical officer of health, and Dr. Stevenson, the eminent Home Office analyst, whose reports were extremely satisfactory.

Mr. F. T. Clayton, the borough surveyor, explained fully the details of the scheme, which comprises preliminary treatment of the sewage in catch tanks, followed by filtration through bacterial oxidation beds fed by Candy-Whittaker revolving sprinklers; the filtration will be double, firstly through coarse beds, and then through fine beds with the oxidising material Polarite, on the lines of the trial installation which has been in successful operation for four years, and with which the borough surveyor expressed himself fully satisfied.

The new scheme, Mr. Clayton stated, would result in a direct saving of about 900*l.* a year to the borough, and indirectly in a further considerable economy.

Dr. Jacob, medical officer of health, gave evidence that he had examined samples of crude sewage and effluent; the crude sewage contained brewery refuse and also a very large quantity of tannery refuse, yet the effluent was always perfectly satisfactory, inodorous, and below the standard adopted by experts. The effluent was good enough, Dr. Jacob went on to say, to be turned direct into the stream.

Dr. Stevenson's report giving the chemical and bacteriological analyses of the effluent from the trial works was read, and showed 94 per cent. of chemical and over 98 per cent. of bacteriological purification.

It is interesting to note that there was a very large reduction in the bacillus coli communis and in the spores of the bacillus enteritidis sporogenes, while previous bacteriological investigations by Dr. Griffiths showed that the Candy sprinkler system destroyed the typhoid bacillus.

The mayor, ex-mayor and chairman of the sewage farm committee all expressed their approval of the scheme, on which the ex-mayor remarked the Council were unanimous.

At the conclusion of the inquiry Colonel Coke complimented Mr. Clayton upon his plans, and then visited the sewage farm and inspected the existing works and the bacterial installation, which has attracted much attention throughout the country.

## SNOW HILL STATION, BIRMINGHAM.

THE plans are being rapidly pushed forward for the contemplated improvements at Snow Hill Station, which have already been foreshadowed in our columns, and which, says the *Birmingham Daily Express*, when completed, will make the Great Western connection with Birmingham somewhat worthy the importance of the Midland metropolis. As a matter of fact the preliminary work in the direction of Hockley and Handsworth has been in progress for a considerable time, and within a very few weeks operations will be commenced in the neighbourhood of Snow Hill itself. The alterations will involve an expenditure of at least 300,000*l.*, and will be carried out according to the designs of Mr. J. C. Inglis, the chief engineer of the Great Western Company. The existing lines in the direction of Wolverhampton will be considerably widened from Great Charles Street onwards, and new "bay" lines and platforms will be provided for local traffic, with access from Great Charles Street. The impossibility of providing a greater width has been the chief difficulty to be surmounted, but this has been overcome by an ingenious subterranean or low-level arrangement for dealing with parcels and goods traffic. On the "up" or Snow Hill side, the present buildings will disappear altogether, and a bay-line for local traffic (Bordesley, Acock's Green, &c.) will be provided. The station yard for the use of cabs, passengers, &c., still on the platform level, will be considerably increased in length, and an extensive range of offices and other buildings, three storeys in height, will take the place of the present antiquated structure, whilst underneath the parcels and other similar traffic will be handled by means of hydraulic lifts. Work of this elaborate character must necessarily—if the ordinary traffic is not to be interfered with—extend over a very considerable period, and in the meantime the company have not overlooked the creature comforts of the public. Gradually, as circumstances permitted, the railway company themselves have been taking over the management of the refreshment departments on their system. For many years these have been in the hands of Messrs. Browning & Co., of London, but as the leases of various rooms fell in they have been taken over by the railway company, and in the efflux of time the whole of the catering arrangements will, as is the case with the other great railway systems, be under the management of the railway people themselves. That this is in the interest of the travelling public will not for a moment be doubted. Birmingham and Wolverhampton are

amongst the last of the towns to fall within this scheme, and recently the dining and refreshment rooms at Snow Hill were formally opened under the direction of the company's manager, Mr. S. D. Knott. In their new and up-to-date guise they will scarcely be recognised as the stuffy, antiquated rooms of the old days. They have been most elaborately furnished by Messrs. Gaskell & Chambers, Ltd., bar fitters, etc., of Dale End. The woodwork is in light polished oak, with white marble counters, and the upholstery in green leather. The old windows have given place to tastefully-designed cathedral glass by Messrs. Yates & Greenways, and the painting and decorations have been carried out by Messrs. F. Horton & Son, in an artistic arrangement of ivory and peacock blue, a frieze of bold design adding greatly to the effectiveness of the scheme. Mr. C. W. Chambers presided at a dinner, served in the dining-room on the Snow Hill side, at which Mr. C. R. Williams (Engineering Department, Paddington), Mr. Herring, station master; Mr. W. E. Evans, catering department, Mr. A. E. Horton, Mr. Greenways, Mr. H. Hartill, &c., were present, and at which the rooms, under the new management, were formally dedicated to the public use.

## ENGINEERING ACHIEVEMENTS.

A LECTURE was given by Professor Hudson Beare, M.Inst.C.E., Regius Professor of Engineering, Edinburgh University, on "Some Notable Achievements in Engineering during the Past Quarter of a Century." After a brief introductory statement as to the changes in the conditions under which the great mass of our population live, and the marked reduction in the death rate in large cities during the past 25 years owing to the great sanitary works which had been carried out, the lecturer described in detail, as two typical great engineering works executed during this period, the Liverpool Waterworks and the Tower Bridge over the Thames in London. Lake Vyrnwy was the largest artificial reservoir yet constructed in Europe, and was the first in Great Britain in which a lofty masonry dam was employed. The dam, founded on the natural rocky bar which held up the post-glacial lake once occupying this site, was 1,172 feet long at the top, its greatest height from the foundation to the top of the parapet being 161 feet, and its maxi-

## CABOT'S INSULATING &amp; DEAFENING QUILT.

## A PERFECT DEAFENER.

Prevents the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this. Send for Special Book on Schoolhouse Acoustics, illustrated.

## A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Decay, moth, and vermin-proof, and unflammable.

## FIREPROOF, DEADENING.

A fireproofing result infinitely superior to that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

## CABOT'S ASBESTOS "QUILT."

The only scientific deafener. Indestructible by decay, moths, or vermin.

	Per Bale.	Half Bale.

Double Ply...	1 : 16 : 6	1 : 0 : 0
Asbestos ...	2 : 16 : 6	1 : 10 : 0

Bales containing 500 square feet each; half-bales 250 square feet. Weights: Single-ply, 80 lbs.; Double-ply, 120 lbs.; Asbestos, 190 lbs. per bale.

## CABOT'S CREOSOTE STAINS, FOR EXTERIOR WORK.

Unequalled for depth and freshness of colour, durability, wood-preserving properties, and freedom from blackening. Superior to paint for exterior woodwork, and fifty per cent. cheaper. One gallon will cover 100 square feet of surface, two brush coats.

## THE B. &amp; S. FOLDING GATE CO.

19, 20 & 21 Tower Street, Upper St. Martin's Lane, London, W.C.

mum thickness at the base 120 feet. It contained in all some 700,000 tons of masonry. The artificial lake held back by this vast masonry construction was  $4\frac{3}{4}$  miles long and half a mile wide, and had a capacity down to the depth to which the water may be drawn off for supplying the city of Liverpool (at the rate of 40,000,000 gallons a day) of 12,130 million gallons, or over 300 days' supply. The water was drawn off at the water tower, a picturesque masonry structure standing well out into the lake. In this tower were the necessary valves for controlling the admission of water to the aqueduct, and by means of telescopic pipes water was always drawn off from the purest level. It then passed through exceedingly fine wire gauze strainers before entering the aqueduct. The aqueduct was 68 miles long from the lake to the reservoir near Liverpool, and in order to reduce the static pressure it was divided into six sections, between each of which was a reservoir in which the water could rise. This aqueduct passed through three ridges by means of tunnels and across a great number of streams and railway lines, the most difficult crossing being that under the Mersey. When entirely complete, the aqueduct would consist of three  $42\frac{1}{2}$ -inch cast-iron pipes, laid 3 feet under the surface, and following the general contour of the country. At present only one of these had been put in, but all the more costly works had been completed for three. Filter beds had been provided at Oswestry near one of the equalising reservoirs. This great work was begun in 1880, and the dam was completed and filled in 1889. The total cost for the one pipe and the aqueduct was, roughly, 2,300,000*l.* sterling, giving Liverpool a daily supply of 15,000,000 gallons of water, and each additional pipe to complete the three would cost about another three-quarters of a million. The Tower Bridge over the Thames was remarkable both for its architectural features (necessary on account of its proximity to the old Tower of London, connected with so many stirring incidents in the history of the nation) and for the ingenious way in which it solved the difficulty of providing a convenient level for the cross traffic without interfering with the navigation of the river by large vessels. The width of the river from abutment to abutment was 380 feet, divided by the two great piers into a central span of 200 feet and two side spans of 270 feet each. The roadway of the two side spans was slung by means of chains, which passed from the high towers to the abutment towers, and then to anchorages in the solid ground. Those two chains were connected together in the centre by ties passing from one

of the high towers to the other. In order to provide accommodation for foot passengers when the central span was open there was a high level foot bridge, which spanned the 200-foot gap, near the top of the central towers, and in the central towers were staircases and lifts giving access to it. At the road level of the centre span occurred the striking feature of the bridge; the 200-foot gap was spanned by a double bascule or drawbridge; each of the two halves was carried on a pivot in its corresponding big pier, and its tail end was prolonged and loaded with a counter balance. When the two halves were lowered into their ordinary position they together formed a flat arch spanning the gap and leaving a headway of  $29\frac{1}{2}$  feet above high-water mark. By hydraulic machinery, however, they could be raised into a vertical position, leaving a clear water way of 203 feet wide and a headway to the underside of the foot girder of 145 feet above high-water mark. Each of these two halves weighed 1,070 tons, and it was most striking to see the extraordinary ease with which these enormous masses were turned on their pivots to the vertical position, a vessel passed, and they came down once more with the same ease, to form again a complete roadway, and in about two or three minutes in all the traffic was again passing over the bridge as if nothing had happened. It was begun in 1880 and opened by the Prince of Wales in 1892, and cost in all 902,500*l.* The daily traffic across it was enormous. A year or two after it was opened 60,000 foot passengers and 8,000 vehicles crossed every twenty-four hours. At the close of the lecture cordial thanks were awarded to Professor Beare and to the Chairman.

### THE INSTITUTION OF CIVIL ENGINEERS.

At the ordinary meeting on Tuesday, December 16, Mr. F. W. Webb, vice-president, M.A., in the chair, the paper read was "The Rupnarayan Bridge, Bengal-Nagpur Railway," by S. Martin-Leake, Assoc. M. Inst. C.E.

The Rupnarayan bridge at Kola was built by the Bengal-Nagpur Railway Company, and formed part of the direct east coast line between Calcutta and Madras. The Rupnarayan was both a river and a tidal creek. The total discharge had been estimated to be 563,530 cubic feet per second, with a velocity of 10 feet per second. The river was embanked on either side, and the flood-level was considerably higher than the surrounding country; the greatest depth of water before work com-

menced was 17 feet below low water. The bridge consisted of seven spans of 300 feet (314 feet 6 inches from centre to centre of piers) and four spans of 100 feet, two at each end. The piers were all built for a double road, but girders for one road only had been erected.

The piers for the larger spans were founded on steel caissons, 88 feet in height, 63 feet in length and 22 feet in width, with semicircular ends. Each caisson was divided by means of cross bulkheads into three dredging-chambers, 13 feet 6 inches in width. The inner plates of the bottom 12 feet were inclined to a cutting edge, and formed the shoe. Above the shoe, the caisson was built up of rings 4 feet in height, connected together by horizontal angle-bars; each ring could therefore be erected complete, lifted into position, and rivetted to the caisson, thus saving time. Each caisson weighed 385 tons.

The river bottom consisted of a layer of hard blue clay, covered on the east side with silt; this clay extended to a depth of about 10 feet. Below the blue clay, yellow clay, varying in quality, was met with to a depth of 55 feet; below this was sand, and in this sand the caissons were founded. Caissons Nos. 1 and 8 were sunk from ground-level; Nos. 5, 6 and 7 from islands; and Nos. 2, 3 and 4 were lowered and sunk from a floating staging erected on flats.

Work commenced on No. 1 caisson (on the west bank) in August 1897. At first the sinking was carried out by men inside the caisson, the clay sunk through being impervious to water, but at a depth of 16 feet the external pressure was found to be bulging the side cutting edges inwards; dry sinking was therefore stopped and the caisson filled with water. No further attempt at dry sinking was made with any of the caissons. Further sinking was done with dredgers. At a depth of about 78 feet the caisson hung badly and refused to go down; holes were excavated below the cutting edge and some of the internal water was baled out; the caisson then began to move, going down 9 feet in four hours. Baling out some of the water after excavating holes below the cutting edge was found to be a certain method of moving the caissons whenever they refused to follow the dredging. Bruce and Batho dredgers, each having a capacity of 30 cubic feet were used, one in each of the three dredging-chambers. The dredgers were suspended from a horizontal timber supported by a staging of old rails, stiffened with angle-bars. As the caisson sank and more rings were added, lengths of 8 feet were added to the verticals and the lower stiffening-bars were disconnected and refixed to

the newly-added lengths. The verticals were built in as the masonry filling of the caisson advanced in height. Thus no time was lost in dismantling and re-erecting staging each time the caisson was added to. The staging remained permanently in position. The sinking of No. 1 caisson was completed in August, 1898.

In October 1897 islands were constructed for caissons Nos. 6 and 7 by driving piles about 5 feet apart, enclosing a space similar in shape to the caisson, but allowing 5 feet clear all round. Outside sandbags were heaped against the piles, the inside being filled with silt, and on this the caissons were erected. The sinking was done with dredgers. The three steam-hoists working the dredgers were contained in a large barge moored alongside the caisson. Caisson No. 6 was completed in September 1898 and No. 7 in August 1898; caisson No. 5, also sunk from an island, was commenced in December 1898 and completed in September 1899. As soon as these caissons were known to have entered the blue clay the tides were allowed to wash away the islands.

It was not possible, without incurring great expense, to make islands for caissons Nos. 2, 3 and 4, the tides running very strong at their sites. These caissons had therefore been lowered from a floating staging. Two ordinary river flats, 180 feet by 26 feet by 9 feet, had been purchased in Calcutta; these were placed 24 feet apart and carried the staging required. The staging consisted of two parts, the forward position, 40 feet in height, being used for lowering and sinking the caissons. The height was necessary in order to clear the caissons at low water during sinking; the after portion, 20 feet in height, was used for erecting the rings on; three rings could be erected complete on it at one time. The staging was made of Oregon pine, a special consignment of which was obtained from America. The caisson shoes were erected and made watertight on a temporary platform placed over the space between the flats. Each shoe, weighing 75 tons, was lifted by means of sixteen 10-ton Weston pulleys suspended from the top of the staging, each group of four blocks being connected to one hook placed under the cutting edge by means of equilibrium bars. The shoes, having first been raised sufficiently to allow the platform to be removed, were then lowered into the water until a part of the weight was carried by flotation. Rings had then been added until the total height of caisson was sufficient to keep the top above water at high tide after pitching. The caisson was then ready to ground. Previously the moorings of the flats had been adjusted daily.

At the top of the tide the caisson was lowered sufficiently to allow the cutting edge to ground as the tide fell, and any final adjustments for position and span to be carried out. As soon as the loads were taken off the hooks the lowering tackle was disconnected and water admitted into the caisson. No difficulty was found in pitching the three caissons on their exact sites. Caissons Nos. 2 and 4 were sunk by means of Sir Bradford Leslie's boring plant, No. 3; after pitching, by dredgers. The plant consisted of a boring-head with four arms, 10 feet in total diameter, rotated by means of an annular pipe 26 inches in external and 13 inches in internal diameter, bolted together in 8-foot lengths, driven by a small steam-engine fixed to a gear-box bolted to the caisson. Over the side of the caisson was a syphon, one leg running down the 13-inch pipe, the other into the river. Water was pumped into the dredging-chambers by two 13-inch centrifugal pumps. When working, the water due to the head maintained by these pumps flowed up the rotating shaft through the syphon into the river, carrying with it the mud, &c., cut away by the boring-head. Caisson No. 2, commenced in December 1897, was founded in August 1898; No. 3, started October 1898, was founded in August 1899; and No. 4, started December 1898, was founded in January 1900. Caisson No. 4 gave considerable trouble in sinking when only a few feet into the river-bed, and after it had been built up to a height of 40 feet, it one day suddenly tilted over until it was 5 feet 6 inches out of plumb. It was eventually straightened, but finally was founded about 2 feet to the west of its proper position. None of the other caissons were more than 9 inches out in any direction. The tops of the caissons were taken down to low-water level.

The girders were of a semi-bowstring type, each span weighing 546 tons. They were erected on two pontoons of steel, 280 feet by 40 feet by 10 feet. These were built in Calcutta, and designed so that they might afterwards be used for the waggon ferry over the Hugli in Calcutta. Each span was erected complete on the decks of the pontoons and then floated over the piers at high water, the piers having previously been built only to a height of 18 feet above low water. As the tide fell the pontoons floated away and left the span supported on packings. The remaining 15 feet in height of the piers had been built as the spans were lifted. The lifting was effected with 150-ton hydraulic jacks. To obtain as much room as possible the spans were placed alternately on the sites of the up and down roads, and when at the full height, those on

the site of the down roads were traversed over into line with the others. All the bricks and lime used on the works were burnt at the bridge site. The total weight on the base of each pier was 8697.5 tons, or 6.7 tons per square foot.

The actual construction was commenced in August 1897, and the bridge was tested and passed by the Government inspector on May 1, 1900.

### THE AUCTIONEERS' INSTITUTE.

A MEETING of the Auctioneers' Institute of the United Kingdom was held on the 17th inst. at the Medical Examination Hall, Victoria Embankment, when Mr. Walter D. Hollis read a paper on "The Professional Witness." The chair was taken by the president of the Institute, Mr. John Hepper.

Mr. Hollis gave definitions of the professional (or expert) witnesses from Best's "Law of Evidence," and from a work on evidence by Jeremy Bentham, and said he proposed to treat only of the witness whose special knowledge and experience were indicated by the terms surveyor and valuer. This witness probably first came into being at the commencement of railway development, became a distinct figure in the Courts after the passing of the first Stockton and Darlington Railway Act in 1821, and attained a vigorous manhood between the years 1821 and 1856, when nearly three hundred and nine millions of money was raised and expended in railway development in Great Britain. During this period numerous Acts were passed, culminating in the well-known Lands Clauses Act of 1845. Other great projects and Government schemes had since increased the necessity for expert evidence. Parliament stipulates that power to secure lands must have no appearance of confiscation. The principle was equitable, and the landowner not infrequently profited considerably. In all these cases the professional or expert witness formed part of a group representing Justice—though he must philosophically resign himself to be included amongst those not understood by the man in the street. The ordinary citizen could not be expected to understand an arbitration case, nor the reasons for divergent opinions of opposing professional witnesses. Notwithstanding this and even the stern rebukes as to expert evidence which had fallen from the Bench, he hoped the day was far distant when their standard of honour and integrity would be lowered. Surveyors and valuers

had great responsibilities, necessitating in their discharge integrity and honour, as well as wide and varied knowledge. The cases taken before the umpire were the exception, the vast majority being settled amicably without reference; while of those referred, the greater number present difficulties giving scope for a wide divergence of opinion amongst the most experienced of men as to the method or theory which should be adopted in fixing values. The professional career of the valuer was one long lesson in bias. He was trained to it from the first—bias in favour of his clients. Naturally, therefore, in considering a case and preparing his evidence, he concentrated his mind upon his client's interests, and all his ideas and desires for the time being proceeded in that direction. But, granting to the witness a wide margin for natural and possibly unconscious bias, and allowing him fair scope for the selection of principles favourable to his client's case upon which to base his figures, he must not forget old Jeremy Bentham's quaint definition, "A sort of assistants to the Judge," and that, in addition to his client, he owed a duty to the tribunal before which he appeared, and what was more, he owed a duty to himself. Self-respect must come first. Fees were not only useful but indispensable, but the most liberal fees gave little satisfaction unless received under a sense, not only of service ably rendered, but of duties to their clients, their profession, and themselves honourably discharged.

In the discussion that followed, the Chairman emphasised the advantage of the expert witness, as, in advising his client, he frequently prevented the case from going to the Arbitration Court. Mr. Arthur Butler commented on the fact that bias was frequently caused by hostility to the opposing witness. Mr. Boyton, of London, and Mr. J. E. Gunn, of Cardiff, also spoke.

#### THE CAMPANILE OF ST. MARK'S AT VENICE.

THE following "authentic account of the circumstances that led to its fall" is contributed by Signor Pietro Saccardo, formerly architect-in-charge of the Basilica of St. Mark's, to the *Architectural Record* of New York:—

The construction of the Campanile of St. Mark's at Venice, which was built between the tenth and twelfth centuries, was influenced by the crude methods of that period. The walls were composed of large bricks of unequal size, which were obtained by the destruction of ancient monuments. The visible

surfaces of the walls were composed of bricks which were laid in fairly regular fashion; but, in the interior of the walls, the bricks were placed irregularly and bound with inferior mortar.

This fact was established by the downfall in which the edifice subsided into a mound of small fragments, from which rose a gigantic cloud of dust.

The tower had undergone repairs on several occasions in the course of centuries, but these for the most part had been limited to the bell-room, whose final form was of the style of the Renaissance. According to the information obtained from chronicles, it appears that the body of the tower never had had more than partial repairs before the eighteenth century. It had, however, been stuccoed in colour, in imitation of brick, which covering was in recent years only visible in spots.

It was about the middle of the century in question, and exactly in 1745, that serious fissures had been caused by lightning on the side above the Loggetta of Sansovino, and that this side had to be repaired completely.

The work was carried out under the direction of the celebrated Bernadino Zendrini, the engineer of the Republic, and cost 6,800 ducats, a very considerable sum for those times. This restoration, it should be carefully noted, consisted of an exterior wall of brick masonry similar to that used in our own time, laid with a mortar of lime and pozzolana in such fashion that this side of the tower presented a very modern appearance. However, inasmuch as the bricks of the new exterior wall could not be fastened to the older ones of the inner (ancient) wall, large square blocks of stone were set in, to unite the two. The white exterior surfaces of these were visible, scattered over the surface of the wall and set in its angles.

This outer masonry had remained in good condition until 1898, and then only had need of some slight repairs in the upper portion, which were called for by unimportant fissures, which did not affect the general stability of the tower. Thus the Campanile of St. Mark's might have stood for many centuries if the hand of man had not intervened to cause its ruin.

In the month of last June the Ufficio Regionale for the preservation of the monuments in Venetian territory, which had charge of the repairs of the Loggetta, undertook to replace the lead covering of the roof of this little monument.\*

Since the Loggetta was built against the side of the tower, the roof leaned upon its wall, and at the line of union there

\* Under the direction of its associated architect, Signor Domenico Rupolo.

was built into this wall a projecting and sloping coping, which kept the rain from entering the joint between the leaden covering and the surface of the wall.

Those who were directing this work, being under the necessity of renewing the leaden plates, had the unfortunate idea to remove the projecting coping, with the intention of replacing it immediately, and in order to do this they cut into the wall of the Campanile horizontally for more than two-thirds of its breadth. In this manner they seriously weakened the base of the outer wall, which had been built by Zendrini, as above explained. It must be remarked that at this height the outer wall was thinner than above, because a much more considerable thickness had been given to the outer wall above, that is to say, at the points where the lightning had caused the largest fissures in the old wall, whereas a thinner wall had served the purpose lower down. But this was also the portion subjected to the greatest strain, as having to support, to a large extent, the whole weight of the upper wall.

To give the last touch to this misfortune it happened that in cutting through the outer wall the inner one was injured at certain points, and this cutting caused the downfall of a considerable amount of *débris*, thus making a hollow space within, reaching upward, which could not be filled in.

In this fashion, either as a result of the horizontal cutting, which was left open for several days, or as a result of the cavity which had been caused in the interior of the wall, the outer wall of 1745 was thrown out of plumb and perceptible movements began to show themselves in the interior of the tower.

During this time the engineer, Saccardo, architect in charge of the Basilica of St. Mark's, was ill, and no one had mentioned to him that the work was going on. Notwithstanding this, as soon as the Ufficio Regionale invited him to visit the tower on Thursday, July 10, he did so, in spite of his illness, but he immediately perceived that any attempt at repair would be useless, and that the only thing that could be hoped for was that when the cutting had been filled in the outer wall might regain its stability.

It must, however, be remarked that although the architect of the Basilica had been advised of the cutting into of the exterior wall he had not been told of the interior cavity, so that his hopes were justified as far as his knowledge went.

It is also important to notice that up to the given date no obvious signs of danger had appeared in the exterior walls. It was not until Sunday, July 13, that fissures began to appear at

the north-east corner of the tower of such a menacing character that the architect, Saccardo, although still ill, was obliged to make immediate arrangements of thoroughgoing character for the public safety. In fact, on the following Monday at five minutes before ten o'clock in the morning the Campanile fell.

In the manner of this fall evidence was given that the immediate and only cause of the catastrophe was the cutting into the outer wall of 1745, and the damage caused in the ancient interior masonry by this cutting, for the collapse began with the total downfall of the aforesaid outer wall, which preceded by several seconds the complete ruin of the monument.

We may thank Providence that we have not had to lament the sacrifice of any human victim, and that the Basilica of St. Mark's, although only a few metres distant from the Campanile, was not injured at any point by its ruin. It must be added, however, that there was a victim, and this victim was Signor Pietro Saccardo, architect of the Basilica, who, having laboured in years past to repair the Campanile, had had the pain of seeing his undertaking interrupted by the plots of envious adversaries. On this last occasion he was removed from office with enormous injustice, even though temporarily, in spite of the patent evidence of his complete innocence and without regard to his age, to his forty years of service and to his infirm health, while the real culprit of the catastrophe still tranquilly retains his position. *Cherchez la femme—La Politique.*

An investigation is, however, pending, through which one may hope that justice will be done if there is still an atom of justice to be had in this world. And if against all evidence that justice should not be done, it is not only the architect, Saccardo, who will have been injured, but also his host of friends, who within a few months had presented him a gold medal for his services to the Basilica of St. Mark's.

#### FUTURE OF THE IRON TRADE.

A LECTURE was delivered at the Birmingham University by Mr. J. Stephen Jeans, secretary of the British Iron Trade Association. Mr. Jeans started with the assertion, says the *Birmingham Daily Post*, that the conditions on which the success and prosperity of the iron and steel industries, whether in this country or abroad, depended were the supply of raw materials at a low cost, the command of adequately skilled

labour, free from liability to exactions and restraints likely to interfere with its maximum efficiency, a temperate climate, a geographical position which facilitated easy and inexpensive access to the world's markets, good administration, economical transport and fiscal systems that tended to promote expansion. The iron industry of the British Isles held for many years an almost unchallenged position in regard to most of these conditions. But from 1870 other nations had rapidly come to the front. Since 1890 our American cousins had made most of the running, until they now produced nearly one-half of both the iron and the steel manufactures throughout the world, occupying in this regard the same relative position, but on a greatly extended scale of operations, that England did in the middle of the nineteenth century. France now produced only one-third of the annual output of iron by Germany and Great Britain respectively. Austria-Hungary and Russia, which came much later into the field on anything like an extensive scale, were somewhat behind France in their annual yield. Belgium only produced one-half of the quantity of iron produced by France, and less than one-seventh of our own annual production, while Sweden produced little more than one-half the annual output of Belgium. Concerning the supplies of raw material, he remarked that it might be some satisfaction to reflect that while our supplies were probably nearer exhaustion than those of our greatest rivals, those rivals would, within the next half-century, at the present rate of exhaustion, have probably more reason to be alarmed for their future than our own country had to-day. It was certain that no country could now be said to have supplies that were correctly described as inexhaustible. That word was much more fitly applied to many stores of iron ore when the world's production of pig-iron was under six or ten millions a year—as it was in the earlier half of the nineteenth century—but now that the world's output of iron had risen to considerably over 40 million tons, involving the consumption of probably 130 to 140 million tons of ore, the word "exhaustion" had come to have a practical and an immediate import which it never had before. Even the vast deposits of Lake Superior might have their duration measured by the span of a single generation, or two generations at the most.

The future of the British iron industry would greatly depend on the extent to which it could command cheap and abundant raw materials in the form of ores and fuel. It was apprehended by some authorities that our outlook was far from satisfactory in respect of both. Not that the supply was exhausted, but

that its extent was uncertain and its quality tending to inferiority. The ores of the West coast occurred in veins or pockets, which had a habit of suddenly giving out when least expected. Some of the largest deposits in West Cumberland had been practically exhausted. Others promised to yield a large output for many years to come. Of such were the famous Hodbarrow mines, which had produced for many years an average of 350,000 to 400,000 tons annually, and on which an expenditure of 300,000*l.* or more was now being undertaken with a view to mining under the estuary of the Duddon. It was understood, by the way, that this company had for many years past paid from 30,000*l.* to 40,000*l.* a year in royalty rents to the Earl of Lonsdale, and parenthetically it might be added that the company had earned profits sufficient to pay an average dividend over the whole period of 40 per cent. to 50 per cent. On the West coast explorations were continually being carried on for the purpose of discovering new supplies of ore, but with only a limited amount of success. No one knew, and hardly anyone ventured even a conjecture, as to the quantity of hematite ores still unworked on the West coast. The assumption that there might be as much ore left as had hitherto been worked was a purely conjectural one, and had no really sound foundation. It was not entirely reassuring to find that most of the leading companies in this district—the Barrow, Millon & Askham, Cammell's and others—had taken steps to largely supplement their home sources of supply by imports of foreign ores, and that the total quantity of foreign ores brought into the district now approached one-half of the total consumption, whereas twelve years ago it was not 20 per cent. of the total, and twenty years ago it was practically nil. So far as the Cleveland district and other districts furnishing lias or kindred ores were concerned there was a vast reserve still available, although the grade had for a number of years past been declining and was likely to continue to do so.

The problem of the future, therefore, would be at what cost could low-grade ores be worked at a profit in competition with other ores, and on that question no adequate reply was at present possible. If he were asked for an opinion as to the district which had the most promise for the future, he would hardly name that in which they were met. All other things being equal, the manufacturing district that lay near to the sea and close to important coalfields had the greatest opportunity of doing an important business. Cleveland, South Wales and Scotland had these advantages, but in this unfortunate district railway charges went far to kill the iron industry. Up to fifty

years ago the only iron of commerce was finished iron. It had long been prophesied that the finished iron industry was destined to be extinguished, but general prophecies of that kind were not entitled to much consideration. Still there had been a great decrease. He recollected that within the last year or two South Staffordshire works had been sold for little more than scrap value. Not much progress could be expected from an industry which showed such signs. Indeed, it was an indication of conservative ideas that that branch had held its own so well. When they remembered that a ton of bar iron cost three or four times the labour to produce that was expended on a ton of bar steel, and that when the iron was produced it was fibrous and heterogeneous, having its strength solely in one direction, while steel was a crystalline product having its strength in all directions, it did seem remarkable that steel had not displaced iron many years ago. That it was so was evidence that there was still a market, and he was happy to believe no inconsiderable market, for the products of South Staffordshire.

Mr. E. Parkes, M.P., remarked that one portion of the paper had not given much consolation to South Staffordshire. There was no doubt that geographically speaking they were in an awkward position, but they must remember that there was a home trade as well as a foreign trade. They must remember that steel as a merchantable article, he did not mean the old-fashioned high-priced kind, was to a certain extent on its trial. At the present time he did not think they had had sufficient experience of the lasting properties of steel to know whether it was useful for all the purposes to which at the present time it was put. While he was in America a gentleman engaged in perfecting a mechanical process of puddling told him that he had been doing so because he recognised that there were many purposes for which iron was more suitable than steel. He thought it was to be seen whether it was more suitable as some people held. He took it that that was one of the reasons why Staffordshire held her present position. If iron was somewhat out of place, how was it that the Germans were sending in a large quantity to this district? It was, to his mind, a standing reproach to them that they were not able to cut out this foreign iron. At any rate, it showed that there was a demand for such iron, and he hoped that Staffordshire would soon be again in a position to fully supply that demand. They knew that at the present time a British labour commission had gone to America, and perhaps they had seen the remark that now the representatives of labour had

been over the "bosses" ought to go. He believed that was perfectly true. It would be a good thing for the "bosses" to go to America in greater numbers than they did. When he came back from his own visit he was faced with this difficulty. His first idea was that he would like to scrap the whole of his plant, but there was this to be considered, that in America, and indeed in any protected State, they were much better able to do that. Protection suited them, and they made enormous profits, varying from 3% to 6% per ton on the materials sold at home; and that was the reason why they were able to scrap their modern machinery in a way that it would be impossible for manufacturers to do in this country. It must be remembered that Protection was a thing which gave Germany and America their power over us. They made up by their higher prices obtained for home consumption for the loss made on foreign sales. He did not think the age of private enterprise in the iron trade had ceased. Mr. Jeans had not told them whether he thought trusts were the solution of the difficulties of the British manufacturers. But he (the speaker) thought it must be remembered the trade of this country had been built up by private enterprise, and also that the trusts in America and in this country had private enterprise to compete with, and he was very much mistaken if they would not find that private enterprise would probably win in the long run. They must not be too nervous about these enormous trusts. Even if it had not come yet, they would have their testing day. On the whole, while they made one thoroughly roused, at the same time he thought they had some conditions of prosperity left in this country, and with a little more of the power of spending money, and with a little more enterprise and technical ability, which their rivals had to such an extent, they need not despair that they would have to relinquish their position to the foreigner.

Mr. Haswell expressed the hope that one influence of the faculty of commerce would be to drive away some of the fictions which the newspapers deftly wove into their articles dealing with trade subjects, and would cause the greater dissemination of hard facts. If it did, there would not be so much cause for extreme depression. He, for one, spoke for an enterprise that was not afraid of the future.

Alderman Clayton remarked that they seemed to be convinced of the necessity of higher education, and he hoped they would empower Mr. Parkes to point out from his place in Parliament that while the Government spent an enormous sum on elementary education, it did not do its duty to technical and higher education, as represented by the universities.
